S/09 THE MIGHTY MICRO

**MC6809 PROCESSOR - 20-BIT ADDRESS BUS
DIRECTLY ADDRESSES UP TO 768K OF RAM**

Performance and capabilities never before possible are now available to you in the SWTPC S/09. Computer System. The S/09 uses the Motorola MC6809 processor, the most powerful 8-bit general purpose MPU available. It features more addressing modes than other 8-bit MPU's and an optimized consistent instruction set enhanced by powerful 16-bit instructions. This, plus 24 indexing submodes, promote the use of modern programming techniques like position independent code, re-entrancy and recursion.

The 20-bit address bus makes possible direct addressing of up to 768K of memory without any slow or clumsy processes such as bank switching. RAM memory is designed with independent control and array cards for economical expansion of memory. The DMA and the processor boards can access memory independently for different tasks.

Multuser capability is "built-in". No additional hardware is required to operate additional terminals. A dynamic memory management system can allocate available RAM in as small as 4K blocks to the various users or tasks.

The dual-bus motherboard design used in the S/09 makes adding I/O ports to the system quick and economical. I/O address decoding for all I/O slots is supplied with the system. All serial I/O cards may be quickly programmed to run at standard baud rates from 110 to 38,400.

Both multiuser and multitasking/multiuser operating systems are available for the S/09. BASIC, PASCAL and an Assembler are immediately available. Editor and Debug programs are also available for use in system development.

S/09 complete as shown with 128K bytes of RAM memory, one parallel and two serial I/O ports. . . \$2,995.00
128K memory expansion card \$1,995.00

Low-cost hard disk computers are here

11 megabytes of hard disk and 64 kilobytes of fast RAM in a Z80A computer for under \$10K. Two floppy drives, too. Naturally, it's from Cromemco.

It's a reality. In Cromemco's new Model Z-2H you get all of the above and even more. With Cromemco you get it all.

In this new Model Z-2H you get not only a large-storage Winchester hard disk drive but also two floppy disk drives. In the hard disk drive you get unprecedented storage capacity at this price—11 megabytes unformatted.

You get speed—both in the 4 MHz Z80A microprocessor and in the fast 64K RAM which has a chip access time of only 150 nanoseconds. You get speed in the computer minimum instruction execution time of 1 microsecond. You get speed in the hard disk transfer rate of 5.6 megabits/sec.

EXPANDABILITY

You get expandability, too. The high-speed RAM can be expanded to 512 kilobytes if you wish.

And the computer has a full 12-slot card cage you can use for additional RAM and interface cards.

BROADEST SOFTWARE SUPPORT

With the Z-2H you also get the broadest software support in the

microcomputer field. Software Cromemco is known for. Software like this:

- Extended BASIC
- FORTRAN IV
- RATFOR (RATional FORtran)
- COBOL
- Z80 Macro Assembler
- Word Processing System
- Data Base Management

with more coming all the time.

SMALL, RUGGED, RELIABLE

With all its features the new Z-2H, including its hard disk drive, is still housed in just one small cabinet.

Hard disk drive at lower left can be interchanged just by sliding out and disconnecting plug. Seven free card slots are available. Z-2H includes printer interface card.

Included in that cabinet, too, is Cromemco ruggedness and reliability. Cromemco is time-proved. Our equipment is a survey winner for reliability. Of course, there's Cromemco's all-metal cabinet. Rugged, solid. And, there's the heavy-duty power supply (30A @ 8V, 15A @ +18 V, and 15A @ -18V) for circuitry you'll sooner or later want to plug into those free card slots.

CALL NOW

With its high performance and low price you KNOW this new Z-2H is going to be a smash. Look into it right now. Contact your Cromemco computer store and get our sales literature. Find out when you can see it. Many dealers will be showing the Z-2H soon—and you'll want to be there when they do.

PRESENT CROMEMCO USERS

We've kept you in mind, too. Ask about the new Model HDD Disk Drive which can combine with your present Cromemco computer to give you up to 22 megabytes of disk storage.

Cromemco

Tomorrow's computers now

The single card computer with the features that help you in real life

COMPLETE COMPUTER

In this advanced card you get a professional quality computer that meets today's engineering needs. And it's one that's complete. It lets you be up and running fast. All you need is a power supply and your ROM software.

The computer itself is super. Fast 4 MHz operation. Capacity for 8K bytes of ROM (uses 2716 PROMs which can be programmed by our new 32K BYTESAVER® PROM card). There's also 1K of on-board static RAM. Further, you get straightforward interfacing through an RS-232 serial interface with ultra-fast speed of up to 76,800 baud — software programmable.

Other features include 24 bits of bi-directional parallel I/O and five on-board programmable timers.

Add to that vectored interrupts.

ENORMOUS EXPANDABILITY

Besides all these features the Cromemco single card computer gives you enormous expandability if you ever need it. And it's easy to expand. First, you can expand with the new Cromemco 32K BYTESAVER PROM card mentioned above. Then there's Cromemco's broad line of S100-bus-compatible memory and I/O interface cards. Cards with features such as relay interface, analog interface, graphics interface, optoisolator input, and A/D and D/A conversion. RAM and ROM cards, too.

Card Cage

32K BYTESAVER PROM card

EASY TO USE

Another convenience that makes the Model SCC computer easy to use is our Z-80 monitor and 3K Control BASIC (in two ROMs). With this optional software you're ready to go. The monitor gives you 12 commands. The BASIC, with 36 commands/functions, will directly access I/O ports and memory locations — and call machine language subroutines.

Finally, to simplify things to the ultimate, we even have convenient card cages. Rugged card cages. They hold cards firmly. No jiggling out of sockets.

AVAILABLE NOW/LOW PRICE

The Model SCC is available now at a low price of only \$450 burned-in and tested (32K BYTESAVER only \$295).

So act today. Get this high-capability computer working for you right away.

About the Cover

This month's cover features artist Robert Tinney's concrete realization of the theme for several articles in this issue: today's tools of analysis and design are computers, both as calculating-engines and as non-traditional symbol-manipulators. By implication, if Leibniz were alive today he would be employing a friendly desk-top computer as a tool for examination of concepts ranging far beyond the calculus he helped shape.

James Peterson discusses the advantages and tradeoffs involved in this and other types of Text Compression.

Page 106

Numerical analysis techniques are quite often simplified by the use of powerful number handling algorithms available on large computer systems. A reasonable alternative to such analysis for the small-scale computer user lies in the utilization of the hand calculator. Small calculators continue to expand their capabilities as proven by Pierre Chance in his investigation of Analysis of Polynomial Functions with the TI-59 Calculator.

Page 120

Most methods of estimating a particular function and plotting it require an analysis involving calculus. Timothy Bowker has written a program that performs a simple trigonometric analysis of a function which will yield an accurate approximation of the function and then print the curve on a Hewlett-Packard 9872A plotter. See his article entitled Minimizing Curve-Plotting Calculation.

Page 134

In the analysis of system response, the utility of the transfer function is immeasurable. The transfer function will convert a time domain relationship into a frequency domain relationship, a manipulation that can prove to simplify the solution process. Bryan Finlay presents a clear picture of the concepts involved in a Noniterative Digital Solution of Linear Transfer Functions.

Page 144

The usefulness of microcomputers is increasing as more powerful and varied programming languages are implemented. Christopher Kern provides A User's Look at Tiny-c, one of the more recent languages to appear.

Page 196

Some Notes on Modular Assembly Programming presents several examples of well-written assembler programs. James Lewis feels that a structured approach to program writing helps both the design and implementation processes.

Page 222

Many people use loops in computer programs without really thinking about how they work. In Twenty-four Ways to Write a Loop, W D Maurer illustrates the endless variety of program loops and shows you how to get the most out of them.

Page 241

If you're interested in using your computer to learn Morse code, Mark Bernstein's Morse Code Trainer can help you to practice. His program translates plain text into Morse code and then outputs it through a speaker.

Page 247

Does it take you ten minutes to enter twenty lines of code at your terminal? Are your index fingers worn out from hours of hunting and pecking? Why not use your own computer to learn the useful art of touch typing. Read Arthur Armstrong's article, Thirty Days To a Faster Input.

Page 250

The Fast Fourier Transform (FFT) is a unique algorithm that is necessary for the analysis and reproduction of signal waveforms. However, performing a complex mathematical derivation of the concept is not necessary. Fred Ruckdeschel has formulated a nonrigorous mathematical treatment of the FFT and demonstrates how it may be applied to synthesize a variety of waveforms in the Frequency Analysis of Data Using a Microcomputer.

Page 10

Does data evaporate from your computer's volatile programmable memory when you turn the power off? Perhaps you could benefit from having some nonvolatile memory in your machine. Steve Ciarica explores the useful properties of

electrically alterable read-only memory as he tells how to Add Nonvolatile Memory to Your Computer.

Page 36

After finding software-intensive approaches to audio processing too slow for high fidelity sound, William J Dally set out to develop a system that uses hardware to speed up processing of audio signals. He explains his ideas in Faster Audio Processing with a Microprocessor.

Page 54

Huffman code is a method for compressing text characters by exploiting their relative frequency of occurrence in text. Space savings of up to 50% can be realized using this technique.

MICROANGELO™

HIGH RESOLUTION INTELLIGENT GRAPHICS

Graphics boards have come and graphics boards have gone. None have really given you all the features at a competitive price that you've wanted—UNTIL NOW!

HIGH RESOLUTION 512 x 484 pixel display, from its own 32K random access memory.

INTELLIGENT Resident software emulates a terminal and also accepts high level commands for point, line, region, and variably sized and oriented character generation.

ROCK SOLID DISPLAY No snow, no jitter, no dropout. PERIOD.

INDEPENDENT Z80 driven at 4 Mhz on its own bus, so no address space from your host is used.

OBEDIENT Direct MicroAngelo via the light pen interface or high level software.

TALKATIVE High speed communication with your host over interrupting parallel ports.

EXTENSIBLE Room for up to 8K of PROM.

TIMELY 60 Hertz interrupting real time clock.

EASY TO USE Drop it into any S-100 host and you're up and running.

VERSATILE Composite or direct drive output; provision for external sync for a 512 x 512 display.

AFFORDABLE 895 dollars brings you the creative genius of MicroAngelo.

MicroAngelo is available now. Call Jim Mather at (703) 827-0888 or write us at Micro Diversions, Inc., 8455-D Tyco Road, Vienna, Virginia, 22180 and get creative!

Editorial

On the Importance of Casting Abstractions in Concrete

Carl Helmers

We human beings are a conceptual species. While firmly planted in our animal evolutionary roots, our chief distinguishing characteristic is a degree of development of our mental powers. This characteristic allows us to recursively reflect upon the degree of development of our mental powers, among other things. The idea of a computer as a mental amplifier fits well within this conceptual side of human nature. In part, this explains the intellectual fascination of computing technology, which is available on a widespread basis as the modern personal computer. As a thought recording and amplification device, the computer deals with abstractions admirably. But there is also another side to the human fascination with computing which should not be ignored: the casting of abstractions in concrete forms which are understandable and emotionally gratifying. Here we find the animal side of our evolutionary heritage interacting with the cerebral side, producing a positive human value for an otherwise sterile activity.

Conceptualization exists in human beings. We do it all the time, for it is a part of our nature. Some do it better than others. Like any ability, it varies from individual to individual. Within individuals this ability varies over the course of a lifetime of growth, development and aging.

The content of our thoughts can be explicit models closely bound to the real world as perceived by human senses, abstractions like those of mathematics which are less obviously bound to real-world roots, or even total fantasies such as stories of science fiction, novels, plays, paintings and other forms of art. All innovation and progress start out as a conceptual fantasy, whether or not the fantasy is based on real-world inputs. But, if the fantasy is to be imparted to someone or made into a real-world object, it must be figuratively "cast in concrete" as a tangible and specific item. I make the claim that one tie with our evolutionary past is partly demonstrated by the emotional experience of pleasure derived by seeing concrete and specific results come from efforts directed by an abstract plan.

This is the phenomenon of emotional feedback from intellectual activities, made "real" in some way as a specific action. As I write these words at a keyboard, I am illustrating the phenomenon in the pleasure I derive from formulating my words into an essay. The concepts are certainly in my own mind. I am translating them through specific actions into a concrete form: the words printed on a piece of paper in the form of a draft I send to our copy editors.

In an analogous way, a writer of a science fiction story is a spinner of tales. Such tales are but dreams bottled up in a mind unless they are cast into a concrete form signifying meaning: as an oral or written account transmitted to another mind. We only know that the science fiction spinner of tales exists at all because of this concrete form of his or her fantasy abstractions.

For the fascination of computing, there is ample opportunity for casting abstract concepts into concrete form. Here we get the emotional feedback and confirmation of our understanding about the way a system of concepts works in a specific example. The importance of game programming on computers as a way of learning to write programs and learn about interactive sequences cannot be underestimated.

 **Shugart**

"My Shugart followed me home."

"After working all day with the computer at work, it's a kick to get down to Basic at home. And one thing that makes it more fun is my Shugart minifloppy™. We use Shugart drives at work, so when I bought my own system I made sure it had a minifloppy drive.

"Why? Shugart invented the minifloppy. The guys who designed our system at work tell me that Shugart is the leader in floppy design and has more drives in use than any other manufacturer. If Shugart drives are reliable enough for hard-working business computers, they've got to be a good value for my home system.

"When I'm working on my programs late at night, I can't wait for cassette storage. My minifloppy gives me fast random access and data

transfer. The little minidiskettes™ store plenty of data and file easily too.

"I made the right decision when I bought a system with the minifloppy. When you lay out your own hard-earned cash, you want reliability and performance. Do what I did. Get a system with the minifloppy."

If it isn't Shugart, it isn't minifloppy.

 **Shugart**

435 Oakmead Parkway, Sunnyvale, California 94086

See opposite page for list of manufacturers featuring Shugart's minifloppy in their systems.

™ minifloppy is a registered trademark of Shugart Associates

The act of defining a game as a program and making a specific implementation is this very act of casting an abstraction (the game) into concrete form (the program which allows one to interact with that abstraction).

Just as I cannot partake of the science fiction writer's tale without a concrete form of sensible representation, I cannot play some adventure game in someone else's head. I can play the game only in the concrete form of its traditional letter correspondence mode (a la Dungeons and Dragons) or the computer automated forms of a specific program (with names like Adventure, Zork, etc). This abstraction which is the concept of the game cannot be perceived emotionally except in this form of a specific implementation.

The pleasure of seeing an abstract concept transformed into a concrete representation is one of the key motivations of the experimenter. The experimenter is the person who works creatively with a technology — be it oil paints on canvas or bit patterns in memory — and sees the results at first hand. It is the spirit of the scientist as much as of the artist.

Why should I sit down and design a computer, then build it, then design my own particular style of system software? There are numerous wheels in the computer world which at first sight I do not need to reinvent in various ways. But the way to thoroughly understand an art, science or technology is to participate in it. Thus, I spend effort designing and building computer systems from time to time; I spend effort now and then designing and implementing text editors; I spend effort from time to time designing and implementing simple interactive application programs for mundane tasks. I do not do this without a return on my efforts in the form of the emotional satisfaction and pleasure which come from seeing my abstract concepts implemented in concrete form.

I partake of the pleasure of exploring the possible concepts of a design, settling on one, then working out its hidden implications and feeding that knowledge back into the design. This is the challenge of understanding which motivates our curiosity in any field. It is made quite explicit by the demands of the computer field. Programming a computer is a very abstract concept, yet when that computer program abstraction turns on a

motor in a robot arm, or sounds a note on a music synthesizer in a progression of some fugue, the program has a very real and concrete way of interacting with our senses and emotional evaluations.

This, then, is the true importance of experimentation and the resultant casting of abstract ideas into concrete form: it provides us with emotional confirmation via pleasure of an otherwise valueless thought. The human value of pleasure, or happiness, in turn feeds back into our thought processes, and the cycle continues. The act of translation, from abstract to concrete, aids us in our understanding of the world and our perceptions of it. ■

Progress Report: The 6809 Project

At this writing, September 26 1979, my 6809's central processor card design is complete in the form of a wiring diagram spread over four large sheets of drafting vellum. I have not yet begun to wire the processor, due to a heavy travel and speaking schedule in late summer and early autumn of this year. Once I have finished the actual implementation of the card, readers can expect to see photographs, wiring diagram, and hand-assembled machine language primitives for a terminal-oriented operating system. Timing? As noted earlier, I continue with this project at the sufferance of a 24-hour day. So, the next installment will come when it is ready, and no sooner. ...CH

Articles Policy

BYTE is continually seeking quality manuscripts written by individuals who are applying personal computer systems, designing such systems, or who have knowledge which will prove useful to our readers. For a more formal description of procedures and requirements, potential authors should send a large (9 by 12 inch, 30.5 by 22.8 cm), self-addressed envelope, with 28 cents US postage affixed, to BYTE Author's Guide, 70 Main St, Peterborough NH 03458.

Articles which are accepted are purchased with a rate of up to \$50 per magazine page, based on technical quality and suitability for BYTE's readership. Each month, the authors of the two leading articles in the reader poll (BYTE's Ongoing Monitor Box or "BOMB") are presented with bonus checks of \$100 and \$50. Unsolicited materials should be accompanied by full name and address, as well as return postage.

MORE CAPABILITIES THAN ANY OTHER PERSONAL COMPUTER UNDER \$1,000*

Compare the built-in features of the ATARI®800™ with other leading personal computers. Whether you program it yourself or use pre-programmed cartridges or cassettes, the ATARI 800 gives you more for your money.

Run your own programs? Easy. Just plug in the 8K BASIC or optional Assembler language cartridge, and go. They're ROM based. That means more RAM for your programs.

Also included with the ATARI 800 is an internal speaker and four separate sound channels, FCC approval, a built-in RF modulator, the ATARI 410™ Program Recorder and a high speed serial I/O.

Peripherals? Add up to 48K of user installable RAM. Or up to four individually accessible floppies.

A high-speed printer. And more to come.

Graphics programs? No problem. The ATARI 800 offers 128 color variations: 16 colors in 8 luminance levels. Plus 29 keystroke graphics symbols and 8 graphics modes. All controlled from a 57 character ASCII keyboard. With upper and lower case.

Or, program it our way. There are exciting programs available and many more on the way for the ATARI 800. Business programs. Home Management programs. Entertainment. And with the 410 audio/digital recorder, you can add Atari's unique Talk & Teach™ Educational System cassettes.

Your way or our way, you'll find that the ATARI 800 is probably the most powerful computer that \$999.99* can buy.

And with that power, you get dependability. Dependability built into Atari's custom designed and fully-tested LSI circuitry and lower component count, (less components, less chance for failure).

But if anything ever does go wrong, you'll find a complete network of computer-connected Atari service facilities waiting for you throughout the country.

Make your own comparison. Hands on. Anywhere computers are sold. Or, send for a free chart that compares the features of the ATARI 800 to other leading fully-programmable computers.

*Suggested retail price \$999.99, includes computer console, program recorder and BASIC language cartridge.

Frequency Analysis of Data Using a Microcomputer

F R Ruckdeshel
773 John Glen Blvd
Webster NY 14580

Introduction

People involved with digital electronics often deal with signals in which the voltage or current changes with time. When a pulse is distorted, its shape is generally expressed in terms of *overshoot* or *rise time*.

In the design of analog electronics equipment such as audio amplifiers, great emphasis is placed on frequency response and phase shifts. The performance of consumer-oriented audio systems is not normally specified in terms of pulse rise time or pulse delay. However, such a specification would characterize the system's basic response to the *zeroth order*. The zeroth order qualifier is necessary because rise time is only an approximate (but very useful) description of a system's response to a stepped input. A complete description would be possible through comparative plots of input and output waveforms.

In communications theory both the real-time (signal versus time) and frequency (signal content versus frequency) representations are applied somewhat interchangeably since the object is to transmit real-time signals, such as pulses, over channels having bandwidth and noise limitations. The Fourier transform is used to aid in such analyses. To exercise this analysis technique it is assumed that the system response is linear. That is, if the input signal level is halved, so is the output signal, along with no change in signal shape. It is thus apparent why most digital engineers do not use Fourier transforms; their systems are highly nonlinear, and work well because of the nonlinearity. It is also apparent why audio engineers are heavily dependent on frequency analysis; their systems are highly linear.

The choice of the Fourier transform for electronics analysis is based on the properties of its "basis" functions, sinusoids. For example, in electronic systems which are composed of ideal inductors, resistors and capacitors, sinusoids have the unique property that if a pure sinusoid of a particular frequency is inserted anywhere into a circuit, examination of any other location in the circuit will show a pure sinusoid of the same frequency, though perhaps changed in amplitude and phase. There is no *mode conversion*. In real systems, however, nonlinea-

rities in response can lead to *harmonic distortion*, which is another way of saying *mode conversion*.

Vital to the application of sinusoids in Fourier analysis is a property called *linear independence*. That is, it is not possible to generate a sinusoid of angular frequency w_1 , from the addition (a linear operation) of two other sinusoids having frequencies w_2 and w_3 ($w_1 \neq w_2, w_3$). A nonlinear operation such as multiplication is required for this to occur.

Mathematically speaking, the sinusoidal functions used in Fourier analysis form a complete, continuous, and infinite set of orthogonal functions spanning the space of all real numbers. This should be compared with the analogous digitally-oriented Walsh functions (See "Walsh Functions," September 1977 BYTE, page 190). The Walsh functions form a complete, discrete (but infinite) set of orthogonal functions, also capable of spanning all real space.

Having discussed the basic utility of the functions which compose the Fourier transform, we will now take a brief look at the mathematical structure that will eventually be encoded into a program to calculate frequency transforms.

The Fourier Transform

The basic definition of the Fourier transform operation is:

$$F(w) = \int_{-\infty}^{+\infty} f(x)e^{-iwx} dx \quad (1)$$

where:

$F(w)$ = the frequency transform

$f(x)$ = the function to be transformed

w = the frequency variable (eg: radians/second)

x = the spatial variable (eg: time in seconds)

$i = \sqrt{-1}$

The transform is performed using complex coordinate ($\sqrt{-1}$) algebra and integration. $F(w)$ is thus in the complex domain and is only a mathematical construct. However, $|F(w)|$, the absolute value (or modulus of $F(w)$), is a measurable value. It is defined as:

FIDELITY ELECTRONICS

VOICE CHESS CHALLENGER[®]

THE FIRST THINKING GAME THAT SPEAKS TO YOU

A perfect chess opponent, the Challenger[®] can play against you at infinite levels of skill, from beginner to expert. And . . . it speaks to you . . . calling out all moves, catching errors and announcing game progression. The Challenger[®] is also a superb teacher and it will even suggest your best move. Be warned, however, that the Challenger[®] has 1200 classic book-opening moves and can analyze over three million board positions stored in its tiny computer brain. So, it can be very tough. It is so sophisticated, it is available in either English, Spanish, German or French language.

Other challenging computer games from Fidelity include . . . BRIDGE . . . CHECKERS . . . and BACKGAMMON. At fine stores everywhere.

**FIDELITY
ELECTRONICS, LTD.**
Miami, Florida 33178

The world's largest manufacturer of self-contained, microprocessor based, board games.

$$|F(w)|^2 = F^*(w) F(w) \quad (2)$$

The * operator stands for conjugation (reversing the signs of the imaginary terms). We note that:

$$F^*(w) = \int_{-\infty}^{+\infty} f(x)^* (e^{-iwx})^* (dx)^*$$

If x and $f(x)$ are real (as we will now specify), then we have $x^* = x$ and $f(x)^* = f(x)$, giving:

$$F^*(w) = \int_{-\infty}^{+\infty} f(x) e^{+iwx} dx = F(-w)$$

Thus:

$$F(w) = \sqrt{F(-w) F(w)} = F(-w) \quad (3)$$

Note that, in principle, when performing the integration called for in equation (1), all values of w should be considered, both positive and negative. But since equation (3) indicates that $F(w)$ is symmetrical about $w = 0$, we need only consider (and plot) the function for $w \geq 0$.

$|F(w)|$ is called the *amplitude* or *modulus* of the transform. There is also a phase term in the transform which complements the modulus description. For the purposes of this article, however, the phase term will not be considered.

To calculate $|F(w)|$, we observe that:

$$|F(w)|^2 = \{Re F(w)\}^2 + \{Im F(w)\}^2 \quad (4)$$

The *Re* and *Im* operators denote that the real and imaginary part of $F(w)$ are to be taken respectively. These are:

$$Re F(w) = \int_{-\infty}^{+\infty} f(x) \cos (wx) dx \quad (5a)$$

$$Im F(w) = \int_{-\infty}^{+\infty} f(x) \sin (wx) dx \quad (5b)$$

To finally arrange the above equations into a structure suitable for computer calculation, we consider $f_i = f(x_i)$ to represent the data value (perhaps from an equation or experiment) at position x_i . For simplicity we consider the data points to be equally spaced; $x_{i+1} - x_i = \Delta x$.

We also consider f_i to exist only over the interval x_i to x_{i+1} . Outside that interval, f_i will be defined to be zero. Combining the above considerations into a program-mable form we have:

$$|F(w_j)|^2 = \{\sum_{i=1}^N f_i \cos (w_j x_i) \Delta x\}^2 + \{\sum_{i=1}^N f_i \sin (w_j x_i) \Delta x\}^2$$

Equation (6) is the basis for the present computer calculation of the Fourier transform of the function represented by $\{f_i\}$. The computer program shown in listing 1 performs this calculation and plots the results.

Note that the number of input data points is N . For an equivalent, but not redundant frequency space description, $N/2$ transform points are required. From an inspection of equation (6) it is apparent that the number of calculations increases by N^2 if a numerical implementation of the integration is applied. Thus, if the number of data points is doubled, the computing time roughly quadruples. The Fast Fourier Transform (FFT) algorithm reduces this dependence. For limited data sets (less than fifty data points), the routine shown in listing 1 takes on the order of fifteen minutes or less in North Star BASIC on an IMSAI, which is acceptable when compared to the large programming complexities associated with implementing an FFT for an arbitrary length data set. The trade-off is between available programmer's time and processor time; my computer lost in the trade-off.

For those interested in further investigation of Fourier transform techniques, an excellent book on the subject is *The Fast Fourier Transform* by E O Brigham, published by Prentice-Hall. Brigham not only presents FFT algorithms, but also reviews continuous transform theory, as well as the errors (particularly at high frequencies) associated with discrete transforms such as the one used here. He also considers reconstruction of the original data set using the calculated frequency transform.

The Discrete Fourier Transform Program

The computer program presented in listing 1 is written in North Star BASIC and is user-oriented. It allows the scale of the automatic data and frequency plots to be adjusted to fit the available terminal width. All plots are shifted and scaled such that they use the maximum terminal width established by the user. Thus, even the owner of a thirty-two-character wide video display can use this program.

The program requires the beginning and ending coordinates (X_1 and X_2 respectively) of the data set as well as

Tremendous Savings on Refurbished AJ Couplers/Modems

Your chance to buy the best from the world leader in data communications. We have a variety of couplers and modems—formerly on lease to our customers—fully refurbished. This is a rare opportunity for you to have the same models used by the largest companies in the world.

- Some models under \$100!
- 30-day parts/labor warranty
- Nationwide AJ service network
- Fast delivery
- Variety of models—up to 1200 baud
- Limited quantities
- Use your Visa or Master Charge

Act now. First come, first served. Write Anderson Jacobson, Inc., 521 Charcot Ave., San Jose, CA 95131. Or call your nearest AJ office:

San Jose, CA Rosemont, IL Hackensack, NJ
(408) 946-2900 (312) 671-7155 (201) 488-2525

**ANDERSON
JACOBSON**

Listing 1: This program will input and plot the data set, then determine the transform and display it graphically. The program is written in North Star BASIC, but features particular to this BASIC were avoided so that the software may be run on most BASIC interpreters.

number of data points, N , as initial inputs. It then asks for a frequency scale factor (to be discussed shortly). After receiving this information it then asks for the N data values, f_i . These are plotted, and the computer subsequently enters the Fourier transform calculation, which may take several minutes. At the end of this calculation, the N frequency data points are printed out. This is where the effect of the frequency scale factor becomes evident. With a scale factor of unity, the Nyquist sampling criterion is used to determine the maximum frequency to be used in the transform calculation. The frequency range is divided into $N-1$ intervals, and the frequency space data points are plotted at the associated N

We're looking for the most original use of an Apple since Adam.

What in the name of Adam do people do with Apple Computers?

You tell us.

In a thousand words or less.

If your story is original and intriguing enough, you could win a one-week all-expense paid trip for two to Hawaii. Which is the closest we could come to paradise.

Win fabulous prizes for creative writing.

To enter, drop by your nearest Apple dealer and pick up an entry blank. Fill it out. Then write an article, in 1000 words or less, describing the unusual or interesting use you've found for your Apple.

A jury of independent judges will cast the deciding vote for the grand prize: a week for two, airfare included, in Hawaii.

The judges will also choose 16 additional winners, two each from eight categories:

graphics/music, entertainment, home, business, education, scientific, professional, and industrial. And each winner will choose from a long list of longed-after Apple peripherals—from Apple Disk II's to Graphics Tablets to printers. Or you can take a \$250 credit towards the purchase of any Apple product.

The contest ends March 31, 1980. All winners will be notified by May 15.

Entry forms are available at your participating Apple dealer. Call 800-538-9696, (800-662-9238 in California), for the one nearest you.

Mail the entry blank, your article and any photos to: Apple Computer, "What in the name of Adam" contest, 10260 Bandlely Drive, Cupertino, CA 95014.

And may the juiciest application win.

Circle 17 on inquiry card.

Figure 1: Initializing routine for a seventeen-point approximation of a one-period sine wave. The period chosen was 2π . Thus, the characteristic frequency associated with this sine wave is one radian per second.

Figure 2: Computer responds with a plot of the data set. For added clarity, lines have been drawn between the plotted points on this and all subsequent figures.

boundaries. With an inputted scale factor greater than unity, the maximum frequency is reduced correspondingly. This gives better resolution for examining low frequency components. Scale factors less than unity are not permitted.

A sample run for a seventeen-point approximation of a single period of a sine wave is shown in figures 1, 2, and 3. We expect to see no "power" at $w=0$ on the frequency plot because the average value of the data set is zero. Such is the case, since the signal approximated is a discrete truncation of a continuous sine wave having a frequency of one radian per second. However, because the wave has been truncated, there are many other frequency components present which not only spread out the power around the one radian per second point, but also appear to shift the frequency spectrum maximum towards a lower frequency. The same features are apparent in figure 4 where the frequency resolution has been increased three-fold.

Truncated Sine Waves

The plots presented in the last section demonstrated that, although we intuitively expect a peak in the frequency spectrum at the sine wave frequency, none is apparent. If figure 4 is viewed with a little imagination, however, it is possible to see that the complete spectrum is composed of two parts, with one part having a peak at the sine wave frequency, thus causing the small bump at $f = 1$ radian per second in figure 4.

Since we have a computer program that allows easy evaluation of frequency spectra, consider the approxi-

mate square-wave data set shown in figure 5. The corresponding frequency plots are shown in figures 6 and 7. Mathematically we expect to see a "sinc" function, $(F(z) = \sin z/z)$, frequency response, with the exception of having a zero at $w=0$. The next zero is expected to be at 2 radians per second. From the frequency plots we see the expected characteristic shape, but with a zero at 1.9 radians per second; the input square wave is not ideal. A direct comparison of figures 3, 4, and 6, 7 indicates that the single-period sine wave has a spectrum similar to that of the single-period square wave, with the important difference that there appears to be more high frequency content in the square-wave spectrum. This is not surprising since there are sharp edges in the square-wave truncation which should lead to more high frequency components than with the sine-wave truncation.

Since the spiked-spectrum characteristic of an infinitely long wave is not very evident in the single-period wave truncation example given above, the question arises: how many sine wave periods are required before the frequency content that is characteristic of the single-period square wave is sufficiently reduced to allow the spiked spectrum to become evident? Again, we can experiment using the computer by entering a thirty-three data point representation of a two-period sine wave and observing the resulting frequency plot (see figure 8). As expected, the infinite sine-wave characteristic is much more evident

Yes, you can do it. Heath makes it simple with easy-to-build kits and step-by-step assembly manuals that lead you from unpacking to final plug-in.

And once you build your own computer, you'll know it inside-out. You'll know how to make it work for you.

Software, designed especially for Heathkit Computers, includes innovative programs

for running your home or business, and exciting games your kids will enjoy.

The Heathkit User's Group (HUG), made up of owners of Heathkit Computers, will share with you a library of over 400 programs that they've written to make your computer serve you in ways you never imagined.

Heathkit Computers may be low-cost kits.

But they're not playthings. They're powerful, high-capacity computers designed for complex programming. You'll find complete systems — hardware, software, accessories — within the pages of the Heathkit Catalog. And you'll find service any time you need it at 55 locations throughout the U.S. or at the Heathkit factory.

FREE CATALOG

For complete descriptions of Heathkit Computers and nearly 400 other electronic kits for your home, business or pleasure, send for the latest, free Heathkit Catalog.

FREQUENCY PLOT (NORMALIZED)

Figure 3: The program outputs a table of transformed data, as well as a frequency space plot.

because the term which appears to be related to the truncation has collapsed two-fold in the frequency span.

To those familiar with Fourier transforms of signals which have been "windowed," the first low frequency zero shown on figure 8 (other than that at $w=0$) is directly related to this "window function." This function may be considered as multiplying an infinite sine wave to give the observed truncation, thus the frequency spectrum of the resulting signal is the convolution (see convolution theory in *The Fast Fourier Transform* by Brigham) of the perfect sine wave spectrum with the spectrum of this window function, the latter having a functional form defined by $(F(z) = \sin z/z)$. As the window becomes relatively

FINALLY, Apple II® software for the discerning computerist, and the not-so-discerning beginner

AppleAids™

Little Tricks™

A series of carefully explained subroutines containing a potpourri of useful programming techniques in Integer Basic and Applesoft, such as specific key stroke identification, timing loops, disappearing question marks on input, no question marks on input, and many more.

Cassette (16K)..... 14.95 Disk (32K)..... 19.95

Scroll Control™

Have you ever wondered why you cannot list an Integer Basic or Applesoft program one screen-page at a time? So have we, and we did something about it! Our machine language Scroll Control, hidden in RAM so as not to "bump" into your program, can be engaged or disengaged at a flick of the keyboard. Why be frustrated when instead you can control the scroll? Cassette 9.95 Disk 14.95

ALTOS COMPUTER SYSTEMS PROUDLY ANNOUNCES

SUN-SERIES

ACS8000-6

THE VERY FIRST

Double Density Z80 Micro-Computer
plus Twin 8" Floppies
plus 14.5Mb Winchester Disk
for under \$9,500!

And more! 4 user CP/M® for under \$12,000!

*CP/M is a registered trademark of Digital Research, Inc.

**ALTOS COMPUTER SYSTEMS, LEADER IN SINGLEBOARD TECHNOLOGY
DOES IT AGAIN WITH ITS SINGLEBOARD ACS8000-6. TOTAL BUSINESS COMPUTER**

HIGH TECHNOLOGY AGAIN

The new ACS8000-6 single board computer is packed with ultra-high technology: Z80 double-density computer, up to 208Kb of high speed RAM, Floppy-disk and Winchester Hard Disk controllers, DMA, up to 6 serial/2 Parallel I/O, optional 32 bit floating point processor . . .

All on One Board, fully socketed, fully documented reliable and maintainable.

ADVANCED MULTI-USER SOFTWARE

Our new ALTOS Multi-User Executive (AMEX) supports four independent CP/M compatible programs in any of six languages: Basic, Fortran, Cobol, Pascal, APL, C, and a wealth of complete business application packages.

WINCHESTER MASS STORAGE

We're staying with Shugart for both floppies and Winchester hard disk. Why? Simple, low price, solid reliability and they're our next door neighbor. Our single board computer supports up to 4 Mbytes of floppies and 58 Mbytes of Winchester running under AMEX.

FREQUENCY PLOT (NORMALIZED)

DATA PLOT (NORMALIZED)

Figure 4: Same frequency plot as shown in figure 3, but with a 3.0 scale factor condition (three-fold increase in frequency resolution).

Figure 5: Plot of the seventeen-point data set used to approximate a square wave having the same period as the sine wave examined in figures 2 and 3.

wider, the sine function increasingly takes on a delta (or impulse) function characteristic which eventually leads to a spiked spectrum for the resulting transform. Figures 9 and 10 demonstrate this for approximations of four- and eight-period sine waves. The latter plot definitely shows the narrow band spectrum element that is expected for a sine wave. Note, however, that the spread in power around the sine wave frequency still remains.

Frequency-Shift Keying

One of the techniques used to encode digital information for transmission or recording is frequency-shift keying (FSK). In this method a frequency f_0 is associated with the logic state 0, and a frequency f_1 is associated with the logic state 1. Thus a message consists of a sequence of sine wave bursts, each having a characteristic frequency f_0 or f_1 . It is apparent that the ideas and plots developed in the previous section may be directly applied to the consideration of FSK encoding.

If the data-signal center frequency is 2100 Hz (which is equal to $(f_0 + f_1)/2$), and if the desired data-transfer rate is 300 bits per second, then one may expect to see (and subsequently decode) many bursts of seven-period sine waves having frequency spectra similar to that shown in figure 10, though scaled in frequency. Obviously, if the two chosen encoding frequencies are very close together it will be difficult to reliably sort out the signals using a

filter technique. If a linear filter approach is taken, then it is apparent by examination of figure 10 that a minimum frequency separation of about $(f_0 + f_1)/8$ is called for. For a 2100 Hz center frequency, a 500 Hz frequency separation is required. This gives encoding frequencies of approximately 1850 and 2350 Hz. More will be said about the significance of those frequencies later.

The above frequency separation requirement was obtained by considering several factors. These considerations included the decoding technique, filtering, and determining whether or not the frequency spectra are sufficiently separated to allow filter detection (using many dB per octave roll off). Another approach, which is more accurate, is to count sine wave periods or zero crossings. If periods are used, the minimum required frequency separation is that which gives a one-period difference (eg: seven periods versus eight periods). In this case, the required frequency separation comes out to be 300 Hz. This can be reduced to 150 Hz using zero crossings. To get better discrimination than this, a technique such as phase-locked loops must be used, and the results are highly hardware-design dependent.

For the sake of comparison, consider some of the frequencies used in the real world. The standard modem frequencies are separated by 200 Hz; 2025/2225 Hz and 1070/1270 Hz. For standard modem encoding frequencies, you must do more than simply decode by filtering.

Small business systems complete for under \$200 a month. Business software such as Inventory Control, Accounts Receivable and Word Processing available now.

The Chieftain 6800 microcomputer series with capabilities that surpass the Z-80 is made for business systems.

Smoke Signal's quality-packed Chieftain 1.5 features two double-sided 5.25-inch mini-floppy drives and Chieftain III features two 8-inch double-sided floppy drives.

Both microcomputers provide 32K static memory, two serial I/O ports, a 2 MHz processor board, a 2K RAM monitor, a nine-slot motherboard with built-in baud rate generator and gold connectors for high reliability. The Chief-

tain's stylish leather-grained enclosure has its own cooling fan and regulated power supply.

And they're expandable up to 128K memory with up to 4 megabytes floppy disk storage.

The Chieftain series is noted for extremely high reliability as well as ease of operation.

So see your nearest Smoke Signal dealer, he'll be glad to show you how to get your wampum's worth. Systems start at \$2,595.

Smoke Signal Broadcasting, 31336 Via Colinas, Westlake Village, CA 91361, (213) 889-9340

Figure 6: Frequency space plot of the square wave approximated by the seventeen-point data set shown in figure 5.

The MITS 88-ACR audio cassette record interface was originally designed to work at the upper modem frequencies. Difficulty in reliability ensued, and the two frequencies were subsequently changed to 1850 and 2400 Hz. These frequencies are curiously close to those that were derived from the frequency spectrum separation consideration above, and perhaps indicate that the 88-ACR has a poorly operating phase-locked loop combined with some tape flutter. This suspicion is based on the fact that the 88-ACR center frequency is derived from a control voltage which is obtained from dividing down a power supply voltage. Therefore, supply noise/ripple can cause trouble.

One cassette interface board exists which is advertised as able to use preset filters for decoding. Its encoding frequencies are 1200 and 2400 Hz. From figure 9 (four-period sine wave) and figure 10 (eight-period sine wave) it is apparent that sufficient separation should exist between the 1200 Hz signal spectrum (which is the troublemaker; large spread plus harmonics) and the 2400 Hz spectrum to allow for reliable filter detection.

The above has demonstrated how, with a little experimentation using the Fourier transform program, insight can be gained into some important communications principles without going deeply into mathematics.

Figure 7: Same waveform as in figure 6, but with a frequency scale factor of 3.

Noise

In the laboratory the situation will often arise in which the signal of interest is buried in noise. In this section we consider an example in which an eight-period raised sinusoid is covered by uncorrelated noise having roughly the same amplitude as the sine wave. Figure 11 shows a 65 point approximation to a raised sine wave packet having the following form:

$$f_i = 2 + \sin(x_i) \quad (7)$$

The data set may be conveniently generated by insertion of the following statements into the program shown in listing 1:

```

181    X1 = 0
182    X2 = 50.3
183    N = 65
184    FOR I = 1 TO N
185    D(I) = 2 + SIN ( (I-1)*X2/(N-1) )
186    NEXT I
187    GOTO 250

```

The corresponding frequency space plot is shown in

HOW TO MAKE

YOUR FIRST MILLION

New 1.2 megabyte quad-density disk. \$1545.

Now you can afford to put a million bytes of memory in your S-100 system.

Introducing DISCUS 2+2™ full-size quad-density floppy disk system by Morrow. DISCUS 2+2™ gives you 1.2 megabytes per diskette (600K bytes of double-density data per side). And it's all addressable as easily as main memory with the system's exclusive BASIC-V™ virtual disk BASIC software.

Best of all, DISCUS 2+2™ comes complete, assembled, and ready to run for just \$1545. Included in the system price are an S-100 controller, factory-mounted full-size disk drive, a complete library of pre-interfaced software, even cables and connectors.

But you don't have to get your first million in one big megabyte. Morrow's DISCUS/2D™ single-side double-density floppy disk system gives you 600K per full-size diskette for just \$1149, complete and assembled. And when you want to expand to a full megabyte, just plug in a second drive... both the hardware and software are expandable.

And if economy is a real concern, you can still get started on your million with Morrow's DISCUS 1™ 250K single-density disc system. It's delivered complete and assembled for just \$995... and will accept up to 3 more drives.

All three Morrow disk systems meet the Proposed IEEE S-100 standard and are compatible with 2MHz, 4 MHz and 5 MHz S-100 systems. A dual-drive cabinet is available as an option with any density you choose.

Why set your goals low and slow with a mini-floppy system? Get started on your first million with a DISCUS™ full-size system by Morrow. See your local computer shop. Or write Thinker Toys™ 5221 Central, Richmond, California 94804. Or call (415) 524-2101, weekdays 10-5 (Pacific Time).

FREQUENCY PLOT (NORMALIZED)

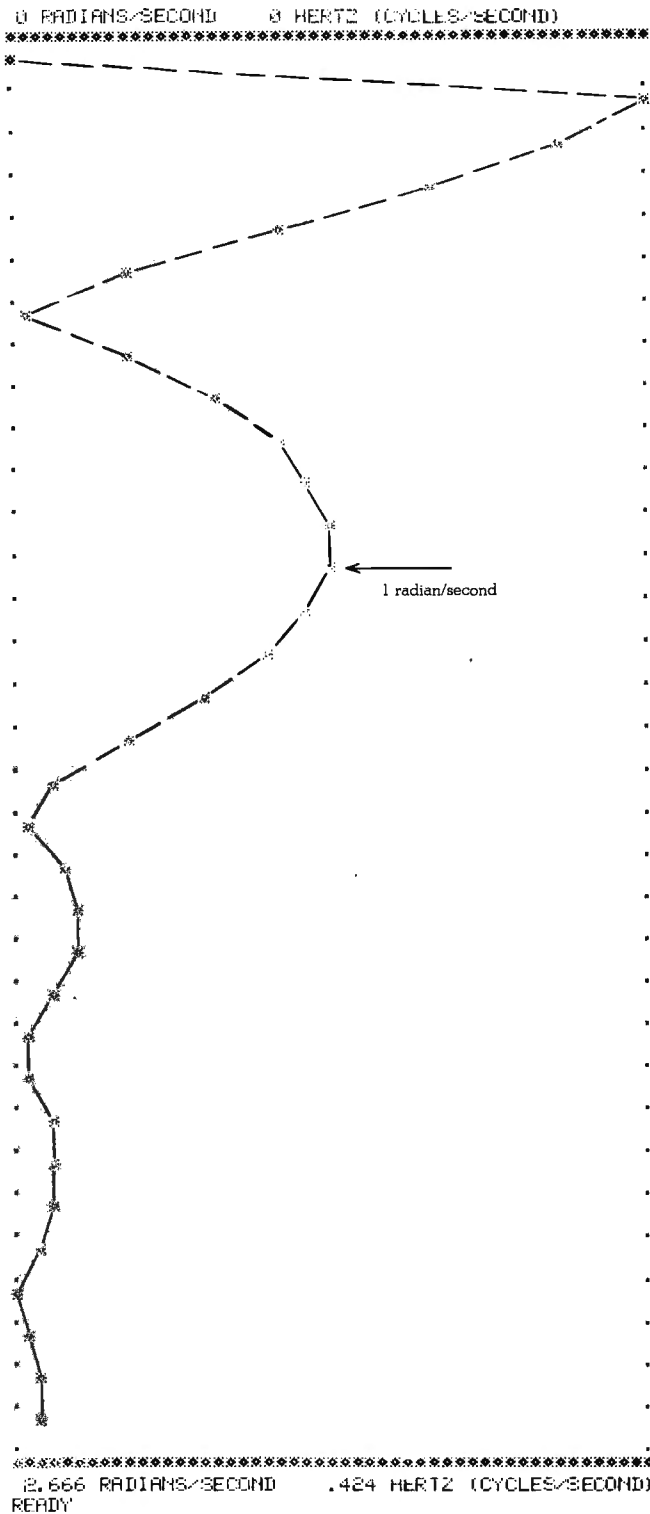

Figure 8: Frequency plot of a two-period sine wave approximated by a thirty-three-point data set. A frequency scale factor of 3 was used.

Text continued from page 22:
figure 12. Observe that there is a large value at $w=0$ which dwarfs the power at the characteristic sine-wave frequency. A high pass filter would remove the $w=0$ term.

FREQUENCY PLOT (NORMALIZED)

Figure 9: Frequency space plot of a four-period sine wave approximated by a thirty-three-point data set. A scale factor of 3 was used.

Figure 13 shows the effect of adding uncorrelated noise to the above sine wave via the following formula:

$$f_i = 2 + \sin(x_i) + 2 \{RND [(I-1)/(N+1)] - 0.5\} \quad (8)$$

Best-selling values from Heath Data Systems

WH89
All-in-One Computer

WH14
Serial Printer

WH19
Smart Video Terminal

Complete line of best-sellers

You'll know why they're best-sellers the moment you see them. They're compact and powerful, designed especially for the needs of business and priced to pay for themselves quickly.

WH89 All-in-One Computer is a completely self-contained system. Now with its own wordprocessing software, it's the ideal choice for reliable, affordable wordprocessing. It has two Z80 microprocessors, mini-floppy storage, WH19 terminal, heavy-duty keyboard and keypad, and 16K RAM expandable to 48K. **All for only \$2295.**

WH19 Smart Video Terminal has a Z80 microprocessor, 24 x 80 display, upper and lower case, direct cursor addressing and 8 user-programmable keys. And it's DEC® VT52 and ANSI compatible. **Only \$995.**

WH14 Serial Printer is microprocessor-controlled and features 5 x 7 dot matrix, upper and lower case, variable pitch/lines per inch, tractor feed, and adjustable paper width. Uses standard ribbon and fanfold paper. RS-232 or 20 mA current loop. **Only \$895.**

Heath Data Systems best-sellers are on display now at your nearby Byte Shop, Computerland, Heathkit Electronic Center, MicroAge Dealer, and other specialty computer stores. OEM's call (616) 982-3361 for quantity discounts.

New from SSM.

80 Character Video

With 80 characters per line our VB3 is the perfect video interface for word processing. It produces a standard 80x24 display of upper and lower case characters or as much as 80x51 for a full page of text. The matrix for graphic display goes up to 160x204. And with optional EPROM, as many as 256 user programmed characters or symbols can be produced.

VB3 is memory mapped for rapid screen updating. But it occupies memory only when activated. So one or more VB3s can be located at the same address with a full 65K of memory still available to the user.

It generates both U.S. and European TV rates and meets the new IEEE S-100 standard. Other features include keyboard input, black on white or white on black, one level of grey, underline, strike thru, blinking char., blank-out char., and programmable cursor. Software includes a CP/M compatible driver and a powerful terminal simulator.

VB3 is available in several configurations. Retail prices start at \$375 kit, \$440 assembled.

Z-80 CPU

We spent over a year designing the CB2 to assure that it will be the most fully S-100 compatible Z-80 CPU on the market.

It operates at 2MHz or 4MHz by DIP switch selection and includes two sockets for 2716/2732 EPROMs or TMS 4016 2K RAMs. Memory sockets can be disabled. Separate run/stop and single step switches allow system evaluation without the benefit of a front panel.

CB2 also features an MWRITE signal, firmware vector jump, and an output port to control 8 extended address lines (allowing use of more than 65K of memory). Jumper options generate the new IEEE S-100 signals to insure future S-100 compatibility.

Retail price—\$210 kit, \$275, assembled.

Our line. CPU, Video, I/O, RAM, EPROM, EPROM Programmer, Music, Prototyping, Terminator, Extender, and Mother boards. Available assembled or as kits.

8080 CPU

Our new CBIA is identical to our popular CB1 with the exception that the on-board RAM has been increased from 256 bytes to a full 1K.

It also features an optional 2K of 2708 EPROMs, power-on/reset vector jump, MWRITE, parallel input port with status and DIP switch addressing.

Retail price—\$159 kit, \$219 assembled.

2116 Walsh Avenue
Santa Clara, CA 95050 (408) 246-2707

Send for our free brochure and find out why SSM has become the favorite of discerning Hobbyists and OEMs.

Why not kill two birds with one stone?

If you have an Apple* and you want to interface it with parallel and serial devices, we have a board for you that will do both. It's the AIO.TM

Serial Interface.

The RS-232 standard assures maximum compatibility with a variety of serial devices. For example, with the AIO you can connect your Apple* to a video terminal to get 80 characters per line instead of 40, a modem to use time-sharing services, or a printer for hard copy. The serial interface is software programmable, features three handshaking lines, and includes a rotary switch to select from 7 standard baud rates. On-board firmware provides a powerful driver routine so you won't need to write any software to utilize the interface.

Parallel Interface.

This interface can be used to connect your Apple* to a variety of parallel printers. The programmable I/O ports have enough lines to handle two printers simultaneously with handshaking control. The users manual includes a software listing for controlling parallel printers or, if you prefer, a parallel driver routine is available in firmware as an option. And printing is only one application for this general purpose parallel interface.

Two boards in one.

The AIO is the only board on the market that can interface the Apple to both serial and parallel devices. It can even do both at the same time. That's the kind of innovative design and solid value that's been going into SSM products since the beginning of personal computing. The price, including PROMs and cables, is \$135 in kit form, or \$175 assembled and tested. See the AIO at your local computer store or contact us for more information.

Figure 12: Frequency space plot of a raised eight-period sine wave as approximated by a sixty-five point data set.

in the frequency spectrum, the sine wave component is clearly evident. Thus, to recover information about the amplitude of the sine wave component, you could use a narrow band filter to look at the spectrum content in the vicinity of the sine-wave characteristic frequency. Using Gaussian noise in this example gives much the same result.

Noisy data sets, as above, can be created (us-

Beautiful "Computer Chess" Reproduction—only \$4.95!

This dramatic reproduction of the October '78 Byte cover art has been produced with the same care and quality as limited edition prints—yet it is available for the price of a poster.

The overall size is 18" x 22", which includes a 1½" border. It is printed on heavy, 80 lb., matte finish, coated stock, excellent for the finest framing if desired.

The price of this quality reproduction is \$4.95, plus \$1.00 for mailing tube, handling, and postage. In addition, the artist, Robert Tinney, will select the 100 finest prints from this first edition for his personal signature and number. These 100 signed and numbered prints will be sold on a strictly first-come basis for \$24.00 plus \$1.00 postage and handling.

See coupon below for ordering.

DATA PLOT (NORMALIZED)

Figure 13: Same waveform as in figure 11, but with noise added.

ing a Gaussian noise distribution) many times. If this is done each time using new random number generator seeds so that there is no correlation between data sets, then the noise will on the average appear to be uniformly distributed along the frequency axis. At the sine-wave frequency that I have chosen, you can expect to see an average noise power ($|F_n(w)|^2$) of some value N_s . If we

FREQUENCY PLOT (NORMALIZED)

Figure 14: Frequency space plot of the transform of the noisy data set shown in figure 13.

measure the power ($|F_s(w)|^2$) at the sine-wave frequency, we can expect to see an average value S_s . The amplitude signal to noise ratio (S/N) is then:

$$(S/N)_s = S_s/N_s \tag{9}$$

If we had instead looked at a sixteen-period raised sine wave having the same characteristic frequency and the

I've finally found a personal computer I respect.

CompuColor II.

ratio available in a personal computer.

The complete system is only \$1595.* And that price includes 8K user RAM, RS-232C compatibility and random access file capabilities.

Our 8 foreground and background colors will boost your comprehension, while introducing you to an exciting new dimension in BASIC programming. The vector graphics have 16,484 individually-accessible plot blocks. And the 13" diagonal measure screen gives you 32 lines of 64 ASCII characters. You also have the flexibility that comes with 16K Extended Disk BASIC ROM.

CompuColor II offers a number of other options and accessories, like a second disk drive and expanded keyboard, as well as expandability to 32K of user RAM. Of course we also have a whole library of low-cost Sof-Disk™ programs, including an assembler and text editor.

Visit your nearest computer store for details. And while you're there, do some comparison testing. With all due respect to the others, once you see it, you'll be sold on the CompuColor II.

**CompuColor[®]
Corporation**

same impressed noise level, the average noise power would have been twice as great, or $N_{16} = 2N_8$. This conclusion is based on the noise power \times time product. The total energy in the sine wave component (the energy in the bump at $\omega =$ one radian per second) also doubles. However, we have seen in the previous examples that the width of the sine-wave component narrows as the number of periods increases (width in frequency space is proportional to the inverse of the number of periods). Thus, the power at the characteristic frequency for the sixteen-period sine-wave quadruples, or $S_{16} = 4S_8$. The power signal to noise ratio is:

$$(S/N)_{16} = 2 (S/N)_8 \quad (10)$$

It can be shown that by increasing the length of the sine wave sampled by a factor n you can improve the amplitude S/N by \sqrt{n} . (Lock-in amplifiers can also be used to improve S/N . Observe that increasing the sampling time is analogous to including more periods; S/N is proportional to $\sqrt{\text{sampling time}}$, or $1/\sqrt{\text{bandwidth}}$.)

Conclusion

The computer program presented in listing 1, although not optimal in efficiency, is reasonably universal and capable of being used in many applications. The application considered above was the evaluation of frequency-shift keying encoding method, in terms of decoder bandwidth, band separation, and noise immunity.

A simple extension of the program could be implemented by generating the phase component of the complex frequency spectrum. This can be done by placing another few statements in the program:

```
Insert: 805 P(I) = ATAN (S1/C1)
Add: DIM P(I), print and plot routines
```

$P(I)$ represents the phase in radians. Since North Star

BASIC, Version 6, Release 2 does not have the inverse tangent function, an additional subroutine for calculating the inverse tangent would be necessary. For the examples given above, the phase response was not an important consideration, and would have increased the computing time.

The use of the complete transform, both amplitude and phase, encourages some interesting experiments in the realm of signal recovery. For example, a low resolution signal (eg: an image scan such as that from an analog barcode reader) could be transformed, and the resulting transform could be corrected for the device response. The resulting corrected transform could then be retransformed back into signal (optical image) space. This is particularly easy (and effective) when the device response is stable and there is sufficiently little noise. For example, with a simple optical device such as a grocery store barcode reader, the unaided resolution in terms of edge response may be on the order of 0.005 inches. With correction this can be improved to 0.0005 inches, an order of magnitude improvement in edge response. Such corrections are not uncommon as most quality tape recorders have playback frequency compensation. In the latter case, an analog circuit is used instead of a computer.

The preceding resolution improvement approach is based on the assumption that the system being considered is linear. Optical systems are convenient in this respect, and much can be done with the transforms of optical images—witness the Mariner photos. The program presented here offers the opportunity to experiment with some of these techniques. ■

Glossary

center frequency: 1. The mean frequency of the output wave when modulated by a symmetrical signal. 2. The center frequency in a frequency spectrum plot.

harmonic distortion: The production of undesirable harmonic frequencies at the output, due to circuit nonlinearities when a sinusoidal voltage is applied to the input.

Fast Fourier Transform: (FFT) A mathematical concept that describes the relationship between information in the time domain and the frequency domain. The Fourier transform of correlation functions will yield the power spectra.

flutter: The variations in frequency caused by irregular motion of the recording device during the recording process. Flutter usually refers to high-frequency variations, and the term "wow" denotes low-frequency deviations.

frequency compensation: A technique involving modification of a circuit to improve the linearity of its response with respect to frequency over the existing bandwidth.

frequency response: 1. A measure of how effectively a circuit or system transmits the different frequencies that are applied to it. 2. The section of the frequency spectrum which can be sensed by a device within specified amplitude error tolerances.

frequency-shift keying: (FSK) A method of frequency modulation that involves shifting the output frequency between predetermined values corresponding to the frequencies of correlated sources.

frequency spectrum: An entire range of the distribution of the intensity of an electro-magnetic or acoustic radiation as a function of frequency.

noise immunity: A measure of how sensitive a circuit is to electrical interference or other sources of noise.

overshoot: 1. An initial transient response to a unidirectional variation in input which exceeds the steady state response. 2. The maximum amount by which this transient response exceeds the 100% amplitude level.

phase-locked loop: A circuit which compares the input carrier frequency with the frequency of the voltage

FOR THE VERY BEST IN NORTHSTAR® COMPATIBLE SOFTWARE

DATA BASE MANAGERS SPECIAL!! \$10.00 OFF of Selector-III C2

Selector-III C2: SuperSoft is proud to offer the Selector-III C2 at a special \$10.00 discount. Selector III allows instant recall of any record using any information item in the record. This makes Selector-III the most powerful Data Base Management System in micro-computers today! You can define a data format and begin entering your data in minutes. Helps bring applications on line in hours instead of months. (Note: Selector-III C2 requires CP/M and C BASIC 2, not supplied - also 48K Ram required for some applications) Selector-III C2 is: \$335.00 (\$10.00 off list!). (Manual alone: \$20.00)

BUSINESS

CRS - Client Record System. A complete program package for the insurance agent. CRS will provide you with very fast online access to your client records, print reports and mail labels, and give you all the information you will need to increase your sales through the use of CRS as a **MARKETING TOOL**.

CRS stores a complete record for each client that includes the name, address, telephone #, as well as provisions for customer #, salesman # and up to six policies (expandable if needed). The policy information is complete with both the type of coverage and the company that is underwriting it, as well as exp. date, premium, term, and payment schedule. You also have a remark field.

You can search the files by any field, and CRS supports a powerful 'sieve' search to provide you with all the information you need to increase insurance sales. CRS comes with two(2) user's manuals, one for the owner, and one for office personnel! (minimal system: one drive, 40K RAM starting 2000H) \$250.00 (Manual: \$40.00)

TEXT PROCESSORS

TFS - Text Formatting System. At least a full featured text processor for NorthStar that you can rely on! TFS has left & right margin justification, page numbering, chaptering, page headings, centering, paged output & MORE. Supports powerful text manipulations including: global & local 'search and change,' file merges and block moves. This means that you can restructure your text file at any time to look the way you want it to, you can even 'chain' files together from disk for documents larger than your current memory.

TFS is completely 'load and go' therefore you can start using it at once. You get two(2) user's manuals: one is a Quick Start manual to get you going in minutes, the other is an in depth study of TFS. (TFS requires RAM from 0000H to 2000H) \$75.00 (Manual only: \$20.00)

COMPUTER AIDED INSTRUCTION

MISS - Microcomputer Instructional Support System. A complete, self-contained CAI package applicable to home, school or business education. Includes everything needed to create a sophisticated computer learning environment. MISS allows one to create any type lesson complete with wrong answer branching, re-test, and complete record keeping. The student is prompted 100% of the way and need have no special knowledge. A special feature is the optional use of a unique algorithm which separates spelling errors from incorrect responses. Absolutely no programming knowledge is required. MISS is completely interactive and maintains complete records on any number of students and lessons (limited only by disk space). MISS is a completely flexible system that will allow you to either create lessons or to purchase pre-programmed lessons which run under MISS. Complete with user's manual . . . \$40.00. (Manual alone: \$10.00)

ASSEMBLERS

ARIAN - A complete 8080 assembler that interfaces directly to your DDS. ARIAN is completely 'load and go'. Features include: dynamic file and RAM allocation, custom disk and RAM command capability, several library routines directly accessible by the user. Also, a complete text editor, and system executive. ARIAN is both powerful and easy to learn and use; it is an assembler that you can grow with. Comes complete with a 51 page user's manual (ARIAN requires RAM from 0000H to 2000H) \$50.00 (Manual alone: \$10.00)

ARIAN Utility Package - Several disk based utilities. Includes a complete DEBUG Package: \$50.00

PROGRAMMING LANGUAGES

'Tiny' Pascal - This is the famous Chung/Yuen 'tiny' Pascal. FAST - ELEGANT - STRUCTURED. Local and global variables plus procedure and function independence make 'tiny' Pascal great for high speed applications. Compiles to 8080 code that executes up to 25 times faster than BASIC. You also receive SOURCE to 'tiny' Pascal written in Pascal. This means that you can compile the compiler! Add features, relocate, etc. (you will need 36K to do this) \$40.00

UTILITIES

DEBE - (Does Everything But Eat!) This is a must for NorthStar users. You can: COMPACT & EXPAND BASIC programs. Compacting removes unnecessary spaces and remarks. This saves money and makes for programs run faster. Expanding puts them back again.

Cross-reference BASIC programs by variables and transfer statements.

Global substitutions of variables and transfer statements.
Formatted print outs of BASIC programs as well. \$40.00

SPECIFY SINGLE OR DOUBLE DENSITY

FOR THE VERY BEST IN TRS-80 COMPATIBLE SOFTWARE

'Tiny' Pascal FOR TRS-80

Now you too can have Pascal! The famous Chung/Yuen 'tiny' Pascal has been specially designed for the TRS-80! The full power and elegance of 'tiny' Pascal is at your command. Programs written in 'tiny' Pascal run at least 4 times faster than the same program in BASIC! 'tiny' Pascal is also a great way to learn Pascal programming, & fun too.

Best of all, you only need a 16K Level II TRS-80! No disk is required. The 'tiny' Pascal operating system is self-contained and very easy to use.

'Tiny' Pascal is a subset of standard Pascal & includes: RECURSIVE PROCEDURE/FUNCTION, IF-THEN-ELSE REPEAT/UNTIL, 'PEEK' & 'POKE', WHILE DO, CASE, MORE! (Plus full graphics for your TRS-80).

You can save and load programs to and from tape in both source or compiled form.

You get all this and more, plus a user's manual for \$40.00
DISK VERSION NOW AVAILABLE \$45.00

Energy-Miser

Energy-Miser is a complete heating/cooling analysis program for your home, office or business! With Energy-Miser you can calculate heat loss because of poor insulation, leaky doors and windows, poor planning and more. With Energy-Miser you can predict the annual savings on your utility bills for various improvements or modifications, including: use of solar power, better insulation, opening and closing drapery, etc.

But there is even more: Energy-Miser can also calculate your Return on Investment. That is, you can find your break point for converting to solar, for insulating better, etc. Energy-Miser even takes into consideration the Energy Tax Credit! Energy-Miser is a program designed to save your money!

Energy-Miser is a proven program written by a professional and includes a complete user's manual for \$22.50. (Minimum System 16K Level II, No Disk Required)

controlled oscillator (VCO) by means of a phase detector; the output of the phase detector is fed through a loop filter and then back to the voltage controlled oscillator to keep in phase with the incoming carrier frequency.

phase shift: 1. The difference between corresponding points on the input and output signal waveforms, commonly referred to as the phase angle. 2. A change in the phase angle between two periodic signals.

processor: (CPU - central processing unit) The central control unit of the digital computer. This unit contains the memory, the Arithmetic and Logic Unit (ALU), control circuitry, and general purpose registers. The processor controls the decoding and execution of all machine instructions.

real-time operation: A computer mode of operation in which the input data is received and processed as it is

generated so that the current information may be used to control that process.

rise time: The time required for the leading edge of a pulse to rise from 10% to 90% of its steady-state value. It is proportional to the time constant and is a measure of how quickly the signal makes a transition from one state to another.

signal-to-noise ratio: (S/N ratio) A measurement of the relative quality of a signal. Precisely the ratio of the magnitude of the signal to the magnitude of the noise present.

video display: (CRT - cathode ray tube) a peripheral which presents its data visually on a television-like screen.

Add Nonvolatile Memory to Your Computer

Steve Ciarcia
POB 582
Glastonbury CT 06033

"You know, Ray, sometimes I think I see more of you than your wife does."

He grinned and retorted, "I just dropped over to see what the Circuit Cellar' Frankenstein was cooking up this month."

I fully deserved that. Few have seen the Circuit Cellar, and it does look a little imposing at first. The usual 20-square-foot hobby corner used by most computerists has been expanded to a 1000-square-foot computer room which vaguely resembles the bridge of the starship *Enterprise*. Accented with the eerie appearance of seven video displays and a multitude of strange black boxes emanating menacing sounds, it sometimes becomes an environment of computerized insanity. While I am not interested in creating any monsters, Baron von Frankenstein and I may have a few interests in common. His demise, I assure you, was simply a case of bad press.

"Steve?" Ray said loudly. "What are you working on?"

I was jerked back to reality somewhat abruptly. Visions of a 1932 movie set faded as I turned in my swivel chair to respond.

"I am actually working on several ideas, Ray, but the easiest is trying to put a computer in a car."

Ray quickly cast a doubtful glance

at the 64 K-byte, dual-disk, Z80-based system. Returning his attention to me he quipped, "Where do you plan to put the printer?"

"I do not mean a big computer. I mean a little one, probably a single board. I will have sensors throughout the car to monitor engine speed, temperatures, pressures, and so forth fed to a display visible to the driver. The driver will be able to calculate and keep running totals of gas mileage, monitor the engine performance, and generally maintain a comfortable feeling of safe motoring."

Ray said, "That sounds pretty good. You will obviously have to use CMOS for your computer." His observation was based on his long years of technical experience.

"Why?"

Ray seemed confused at my reply. He expected agreement. Shouldn't complementary-metal-oxide semiconductor (CMOS) components be used since the computer will be battery powered?

"Because it is battery powered. That's why!" he demanded.

"That is not necessarily true." Trying not to seem quarrelsome, I continued. "Let's think about an automobile for a minute. There are many power-consuming devices. A defroster fan or rear-window heater

can draw 100 watts each. Without the floppy-disk drives, even that big Z80 system over there does not pull that much. I am shooting to stay under 20 watts, but logic type does not make much difference."

"Yes, I know when the engine is running there is plenty of power available from the alternator." Ray seemed a bit frustrated in pointing out my misjudgement of the facts. He persisted. "At 12 volts, 20 watts is almost 2 amperes! The 12-volt car battery will not last long with the engine off."

"You do not leave the defroster fan on with the engine off, do you?" I countered.

"Of course not! But what about your program? If it is written into programmable memory such as 2102 or 2114 devices, you'll lose it when the power goes off."

"I said this computer is for automotive use. It cannot be considered as a general-purpose computer. Rather than using only programmable memory with programs loaded from tape or disk, it will have the operating system and language interpreter stored in read-only memory and application software stored in erasable, programmable read-only memory, an EPROM. The only programmable memory needed will be a

6809 PROCESSING POWER!

The Percom SBC/9™. Only \$199.95.

Fully compatible with the SS-50 bus requiring *no* modification of the mother board, memory or I/O slots — the SBC/9™ is also a complete, single-board control computer with its own ROM operating system, BAM, peripheral ports and a full-range baud clock generator.

Make the SBC/9™ the heart of your computer and put to work the most outstanding microprocessor available, the 6809.

the Mighty 6809

Featuring more addressing modes than any other eight-bit processor, position-independent coding, special 16-bit instructions, efficient argument-passing calls, autoincrement/autodecrement and more, it's no wonder the 6809 has been called the "programmer's dream machine."

Moreover, with the 6809 you get a microprocessor whose programs typically use only one-half to two-thirds as much RAM space as required for 6800 systems, and run faster besides.

And to complement the extraordinary 6809, the Percom design team has developed PSYMON™, an extraordinary 6809 operating system for the SBC/9™.

PSYMON™ — Percom SYstem MONitor

Although PSYMON™ includes a full complement of operating system commands and 15 externally callable™ trademark of Percom Data Company, Inc.

utilities, what really sets PSYMON™ apart is its easy hardware adaptability and command extensibility.

For hardware interfacing, you merely use simple, specific device driver routines that reference a table of parameters called a Device Control Block (DCB). Using this technique, interfacing routines are independent of the operating system.

The basic PSYMON™ command repertoire may be readily enhanced or modified. When PSYMON™ first receives system control, it initializes its RAM area, configures its console and then 'looks ahead' for an optional second ROM which you install in a socket provided on the SBC/9™ card. This ROM contains your own routines that may alter PSYMON™ pointers and either subtly or radically modify the PSYMON™ command set. If a second ROM is not installed, control returns immediately to PSYMON™.

- Provision for multi-address, 8-bit bidirectional parallel I/O data lines for interfacing to devices such as an encoded keyboard.
- A serial interface Reader Control output for a cassette, tape punch/reader or similar device.
- An intelligent data bus: multi-level data bus decoding that allows multiprocessing and bus multiplexing of other bus masters.
- Extended address line capability — accommodating up to 16 megabytes of memory — that does not disable the on-board baud rate clock or require additional hardware in I/O slots.
- On-board devices which are fully decoded so that off-card devices may use adjoining memory space.
- Fully buffered address, control and data lines.

The SBC/9™, complete with PSYMON™ in ROM, 1K of RAM and a comprehensive users manual™ costs just \$199.95.

Welcome to Percom's Wide World

SS-50 Bus LFD-400™ and LFD-800™ Systems

Each LFD mini-disk storage system includes:

- drives with integral power supplies in an enamel-finished enclosure
- a controller/interface with ROM operating system plus extra ROM capacity
- an interconnecting cable
- a comprehensive 80-page users manual

Low-Cost Mini-Disk Storage in the Size You Want.

Percom LFD mini-disk drive systems are supplied complete and ready to plug in the moment they arrive. You don't even have to buy extra memory. Moreover, software support ranges from assembly language program development aids to high-speed disk operating systems and business application programs.

The LFD-400™ and -400EX™ systems and the LFD-800™ and -800EX™ systems are available in 1-, 2- and 3-drive configurations. The -400, -400EX drives store 102K bytes of formatted data on 40-track disks, and data may be stored on either surface of a disk. The -800, -800EX drives store 200K bytes of formatted data on 77-track disks.

The LFD-1000™ systems (not pictured) have dual-drive units which store 800K bytes on-line. The LFD-1000™ controller accommodates two drive systems so that a user may have as much as 1.6M bytes on-line.

Mini-disk storage system prices:

MODEL	1-DRIVE SYSTEM	2-DRIVE SYSTEM	3-DRIVE SYSTEM

EXORciser* Bus LFD-400EX™ -800EX™ Systems

Upgrade to 6809 Computing Power. Only \$69.95

Although designed with the SWTP 6800 owner in mind, this upgrade adapter may also be used with most other 6800 and 6802 MPUs. The adapter is supplied assembled and tested, and includes the 6809 IC, a crystal, other essential components and user instructions. Restore your original system by merely unplugging the adapter and a wire-jumpered

DIP header, and re-inserting the original components. Also available for your upgraded system is PSYMON™ (Percom SYstem MONitor), the operating system for the Percom 6809 single-board computer. PSYMON™ on 2716 ROM costs only \$69.95. On diskette (source and object files), only \$29.95.

Data Terminal & Two-Cassette Interface — the CIS-30+

- Interface to data terminal and two cassette recorders with a unit only 1/10 the size of SWTP's AC-30.
 - Select 30, 60 or 120 bytes per second cassette interfacing: 300, 600 or 1200 baud data terminal interfacing.
 - Optional mod kits make CIS-30+ work with any microcomputer. (For MITS 680b, ask for Tech Memo TM-CIS-30+-09.)
 - KC Standard/BI-Phase-M (double frequency) cassette data encoding. Dependable self-clocking operation.
 - Ordinary functions may be accomplished with 6800 Mikbug* monitor
- Prices: Kit, \$79.95; Assembled, \$99.95. Prices include a comprehensive instruction manual. Also available: Test Cassette, Remote Control Kit (for program control of recorders), IC Socket Kit, MITS 680b mod documentation and Universal Adapter Kit (converts CIS-30+ for use with any computer).

of 6800 Microcomputing.

6800/6809 SOFTWARE

System Software

6800 Symbolic Assembler — Specify assembly options at time of assembly with this symbolic assembler. Source listing on diskette \$29.95
Super BASIC — a 12K extended random access disk BASIC for the 6800 and 6809. Supports 44 commands and 31 functions. Interprets programs written in both SWTP 8K BASIC (versions 2.0, 2.2 & 2.3) and Super BASIC. Features: 9-digit BCD arithmetic, Print Using and Linput commands, and much more. Price \$49.95
TOUCHUP™ — Modifies TSC's Text Editor and Text Processor for Percom mini-disk drive operation. Supplied on diskette complete with source listing \$17.95

Operating Systems

INDEX™ — This easy-to-use disk-operating and file management system for 6800 microcomputers is fast. I/O devices are serviced by interrupt request. INDEX™ accesses peripherals the same as disk files — new devices may be added without changing the operating system. Other features: unlimited number of DOS commands may be added • over 60 system entry points • display only those files at or above user-specified file activity level • versions available for SWTP MF-68, Smoke's BFD-68 and Motorola's EXORciser*. Price \$99.95
MINIDOS-PLUS™ — An extension of the original MINIDOS™ for LFD-400™ mini-disk systems, MINIDOS-PLUS™ manipulates files by six-character names. Supports up to 31 files. Resident commands include Initialize, Save, Allocate, Load, Files (directory list), Rename and Delete. Supplied on 2708 ROM with a minidiskette that includes transient utilities such as Copy, Backup, Create, Pack and Print Directory. Price \$34.95
PSYMON™ — Percom SYstem MONitor for the Percom single-board/SS-50-bus-compatible 6809 computer accommodates user's application programs with any mix of peripherals **without** modifying programs. PSYMON™ also features character echoing to devices other than the communicating device, sophisticated register and memory dump routines and more. Price (on 2716 ROM) \$69.95
WINDEX™ — Described in detail elsewhere on this page.

Business Programs

General Ledger — For 6800/6809 computers using Percom LFD mini-disk storage systems. Requires little or no knowledge of bookkeeping because the operator is prompted with non-technical questions during data entry. General Ledger updates account balances immediately — in real time, and will print financial statements immediately after journal entries. User selects and assigns own account numbers; tailors financial statements to firm's particular needs. Provides audit trail. Runs under Percom Super BASIC. Requires 24K bytes of RAM. Supplied on minidiskette with a comprehensive users manual. Price \$199.95.

FINDER™ — This general purpose data base manager is written in Percom Super BASIC. Works with 6800/6809 computers using Percom LFD-400™ mini-disk drive storage systems. FINDER™ allows user to define and access records using his own terminology — customize file structures to specific needs. Basic commands are New, Change, Delete, Find and Pack. Add up to three user-defined commands. FINDER plus Super BASIC require 24K bytes of RAM. Supplied on minidiskette with a users manual. Price \$99.95

Mailing List Processor — Powerful search, sort, create and update capability plus ability to store 700 addresses per minidiskette make this list processor efficient and easy to use. Runs under Percom Super BASIC. Requires 24K bytes of RAM. Supplied on minidiskette with a users manual. Price \$99.95.

And 'looking into' is just what you do with the Electric Window™ as you peer right into memory space where characters are being input and manipulated. Display is memory-resident, programmable and generates up to 24 80-character lines.

Other features include:

- standard character generator plus provision for optional special character generator
- dual intensity, high-lighting alphanumeric display
- scrolling by a programmable register • programmable display positioning
- programmable interlaced or non-interlaced scan
- descenders on lower case letters • users manual with application instructions and listing of WINDEX™ driver.

The Electric Window.™
Worth Looking Into. \$249.95

WINDEX™ is a fast video display driver program for the Electric Window™. WINDEX™ also features: program and keyboard control of character generators • displayable control characters — under program control • automatic scrolling • a driver routine for the parallel input keyboard feature of the Percom 6809 Single-Board Computer, the SBC/9™ • auto-linking to PSYMON™, the ROM operating system for the SBC/9™ • Prices: ROM version: \$39.95; LFD-400™ compatible diskette (source and object files): \$29.95.

Now Available! the SBC/9™ MPU/Control Computer

(Single-Board-Computer/6809) — stands alone as a control computer, but also compatible with the SS-50 bus for use as an MPU card. Includes PSYMON™ (Percom System Monitor) in a 1K ROM and provides for additional 1K of ROM. Also includes 1K of RAM. Features: Super Port — provision for multi-address, 8-bit bidirectional data lines • an intelligent data bus for multi-level data bus decoding • an on-board 110-baud to 19.2 kbaud clock generator • extended address capability — to 16 megabytes — without disabling baud clock or adding hardware. And much more. Supplied with PSYMON™ and comprehensive users manual. Price \$199.95.

See full page ad elsewhere in this magazine for all of the SBC/9™ features.

Full Feature Prototyping PC Boards

All of the features needed for rapid, straightforward circuit prototyping. Use 14-, 16-, 24- and 40-pin DIP sockets

- SS-50 bus card accommodates 34- and 50-pin ribbon connectors on top edge, 10-pin Molex connector on side edge • I/O card accommodates 34-pin ribbon connector and 12-pin Molex on top edge

I/O Bus Card: \$14.95

SS-50 Bus Card: \$24.95

- I/O card is 1-¼ inches higher than SWTP I/O card • interdigitated power conductors • contacts for power regulators and distributed capacitance bypassing
- use wire wrap, wiring pencil or solder wiring • tin-lead plating over 2-oz copper conductors wets quickly, solders easily
- FR4-G10 epoxy-glass substrate.

To place an order or request additional literature call toll-free 1-800-527-1592. For technical information call (214) 272-3421. Orders may be paid by check, money order, COD or charged to a VISA or Master Charge account. Texas residents must add 5% sales tax.

Text continued from page 36:

scratch pad for calculations and a small area set aside for storage of continually updated, long-term quantities like mileage and gas consumption."

Ray was not incorrect. The language interpreter and application program *could* reside entirely in programmable memory as in most older personal computers. Memories composed of 2102A devices can, in fact, be put in a stand-by mode by dropping the power-supply voltage to 2 V. This reduces power consumption by 80% while still retaining data.

While being practical under most circumstances, stand-by operation is not a total solution. Depending upon the system configuration, memory power might have to be sequenced on and off, and perhaps be isolated from the 5-V supply of the rest of the system.

The ultimate value of this technique is dependent on efficient power conversion. A 12-V-to-2-V converter with 50% efficiency would be self-defeating. Battery power, however much reduced, is still required as long as memory data is to be retained.

Hybrid computers exist wherein high-speed, bipolar microprocessors are mated with low-power CMOS memory. Such a system could have various forms of read-only memory as before, but in the form of complementary-metal-oxide devices rather than bipolar memory chips.

Data retention time would probably be an order of magnitude longer, but there are complications associated with mixing logic families. All things considered, if it were not for the high cost of CMOS memory, I would use it.

Ray persisted, saying, "You still have to provide continuous power for *some* programmable memory if you intend to store those long-term values." Ray was convinced that I must have constant power on something. I hated to disillusion him.

I explained, "Not necessarily. I considered the usual standby-mode programmable memory, both CMOS and bipolar types, and rejected them. Bipolar standby takes too much power; and CMOS memory chips might be destroyed by physical handling. This is experimental, you know."

Ray said, "If you intend to shut off

the computer entirely, then I suppose you could write out data to an audio cassette to be reloaded when you start the car."

I said, "Well no, I want this to be automatic. I should be able to get in the car, turn the key and have the computer start too. The tape player in the car is for Bartok, not for Kansas City data." I paused slightly to allow the air to clear, and then continued. "I have been thinking of using nonvolatile programmable memory."

Ray's jaw dropped. "Nonvolatile? Do you mean *core* memory?"

While magnetic core memory is indeed nonvolatile, that was not what I meant. "No, not core, but *semiconductor, nonvolatile programmable memory!*"

Though Ray is quite technically aware, this was a new concept for him and he wasn't sure if I was serious. I have been known to play jokes like this before.

To convince him that I was serious, I began to explain, "Specifically, I am talking about *electrically alterable read-only memory*, or EAROM. You should consider it as a *read-mostly* memory."

"Well, that's different!" Ray exclaimed with relief. "You didn't say read mostly!"

All About the EAROM

EAROMs are *word-alterable* read-only memories intended for use as "read-mostly" memories. On the surface this may sound similar to an EPROM (erasable, programmable read-only memory). Once erased under ultraviolet light, an EPROM is indeed a word-alterable read-only memory.

In reality, there is very little similarity between the electrically alterable and erasable, programmable memory. An EPROM can be erased only in block mode and generally takes about 10 minutes to erase. While some can be programmed in as little as 50 seconds, an 11-minute (or more) read/write cycle-time hardly qualifies it in the category of high-speed programmable memory. An EPROM, therefore, is just a conveniently reprogrammable read-only memory.

An EAROM, on the other hand, does not rely upon ultraviolet light exposure for erasure. Clearing memory for reprogramming is done

Introducing the First CP/M Compatible Desktop Computer with Color Graphics.

The new Intecolor 8063 is the first desktop computer to combine the advantages of color alphanumeric and graphics with the versatility of CP/M. For unprecedented flexibility at a price within the reach of most small businesses, the Intecolor 8063 is the answer.

What does CP/M mean to you? An abundant selection of readily available software. There are CP/M programs for most business applications, minimizing the need for specially-prepared software.

Load the CP/M Operating System Disk and you're ready to run any CP/M program (without modifica-

tion), whether it's in BASIC, FORTRAN IV, or any other programming language. Add the superb readability and improved comprehension of color graphics and you've got unparalleled desktop performance.

Standard features of the Intecolor 8063 include a 19" color display with an 80 character x 48 line format, 32K of user RAM (expandable to 48K), and a dual 8" floppy disk drive with 591K bytes of storage (expandable to 1.1 megabytes).

Plus you get ISC's color version of Microsoft Business BASIC on floppy disk. All for just \$5995.* Incredible? Indeed, and only from ISC, the world's largest supplier of color CRT terminals.

If your application calls for it, Microsoft FORTRAN IV is available from ISC for \$150.00.*

So if you want to spend more time computing than programming, contact your ISC sales representative today. Or check out the 8063 at selected computer dealers. CP/M in color. Only from ISC.

Color Communicates Better

Photo 1: Shown here are the General Instrument ER3400 and ER1711 electrically alterable read-only-memory (EAROM) parts. The ER3400 has only the EAROM function; the ER1711 combines the functions of programmable memory and EAROM in a single part.

ASCII encoded keyboards as low as \$65*

The RCA VP-601 keyboard has a 58 key typewriter format for alphanumeric entry. The VP-611 (\$15 additional*) offers the same typewriter format plus an additional 16 key calculator type keypad.

Both keyboards feature modern flexible membrane key switches with contact life rated at greater than 5 million operations, plus two key rollover circuitry.

A finger positioning overlay combined with light positive activation key pressure gives good operator "feel", and an on-board tone generator gives aural key press feedback.

The unitized keyboard surface is spillproof and dustproof. This plus the high noise immunity of CMOS circuitry makes the VP-601 and VP-611 particularly suited for use in hostile environments.

The keyboards operate from a single 5 volt, DC power supply, and the buffered output is TTL compatible. For more information contact RCA VIP Marketing, New Holland Avenue, Lancaster, PA. Telephone (717) 291-5848.

*Optional user price. Dealer and OEM prices available.

electrically. With a read time equivalent to a high-speed EPROM, complete or partial erasure in 10 ms, and a write time of a mere 1 ms, an EAROM fills the gap between truly programmable memory and EPROM.

EAROM can be integrated into the memory address space of practically any microcomputer. Like regular read-only memory, it retains data (for up to 10 years) when the power is removed, and is a natural choice for bootstrap program-storage applications. Should the stored program have to be changed, you can erase the chip with a 10-ms eraser routine and then rewrite the data at a rate of 1 ms per byte. This can all be done without removing the part from the system.

There are many EAROMs available, but like other types of memory devices, their architectures and capacities vary. You would not use 1 K-bit memory chips if you had to fit 64 K bytes of memory on a small printed-circuit board, nor would you choose to use an erasable programmable read-only memory requiring a 3-voltage power supply if only a 5-V supply is available.

It is important to observe that EAROMs also have limitations. Unlike regular programmable memory, the electrically alterable read-only memory cannot be erased and reprogrammed without limit. The General Instrument model ER3400 EAROM, for instance, can have each byte read 2×10^{11} times, but written only 100,000 times. If this EAROM were being used as standard programmable memory in a frequently executed loop, 100,000 erase and write cycles would take only 20 minutes.

The ER3400 is better used to store tables and calculated results that must be retained if the power fails. The specific, useful qualities of the ER3400 are high density of data storage, high speed, and long time of data retention.

A Hybrid Memory Device

Where nonvolatile memory is required to have more frequent write cycles, the General Instrument ER1711 should be used. This device combines two types of memory on a single chip: a standard 1 K-bit, static programmable memory and a 1 K-bit electrically alterable read-only memory.

A0 thru A9	10-bit word address.
D0 thru D3	Data input and output pins.
\overline{CE}	Chip enable. Chip selected when \overline{CE} is pulsed to logic 0.
C0, C1	Mode-control inputs.
\overline{WE}	Write enable. Input data read when \overline{WE} is pulsed to logic 0.
V_{SS}	Substrate supply. Normally at +5 V.
V_{G1}	Ground input.
V_{DD}	Power-supply input. Normally at -12 V.
V_{GG}	Power-supply input. Normally at -30 V.

Table 1: Functions of pins on the General Instrument ER3400 electrically alterable read-only-memory device.

The programmable memory is mapped as standard program memory. There is no limitation on write cycles. When the memory contents are to be retained, such as at the time of system power-down, a sensing circuit pulses the EAROM write line. With one pulse the entire content of the 1 K programmable memory is written in parallel to the EAROM. The EAROM section has the same write-cycle limitations as the ER3400 part.

Devices such as the ER1711 are particularly suited for storing frequently changing data. As long as power is available to the system, this data resides in the programmable memory. Only during periods when the power is off or during special events is the data transferred to non-volatile storage.

Design Choices

Each of the two EAROM devices has its good and bad features. The designer choosing EAROM parts for

a memory system will have to choose among the various positive attributes and complications. No single EAROM part necessarily fits all applications. The application must determine the choice.

Failure to understand this fact and lack of adequate knowledge of the variety of parts available are contributing factors to the absence of electrically alterable read-only memories in personal computers. The two devices I have chosen to discuss should cover most applications, but other configurations do exist.

General Instrument ER3400

The ER3400 is a 4 K-bit EAROM configured as 1024 by 4 bits. 1 K bytes of nonvolatile storage can be obtained using two chips. Figure 1a shows the pinout designations, and figure 1b shows the block diagram of the chip. Photo 1 shows the part in its dual-in-line package. Table 1 describes the functions of the pins found on the ER3400.

The ER3400 requires three power-supply voltages (+5 V, -12 V, and -30 V) for complete operation.

Because of the relatively low currents required to write data into an EAROM, the -30-V supply is usually derived from either the +5-V or -12-V supply. A previous Circuit Cellar article ("No Power for Your Interfaces? Build a 5 W DC-to-DC Converter," October 1978 BYTE, page 22, or page 1 in my book *Ciarcia's Circuit Cellar* BYTE Books, 1979) covered both theory and design procedures, should you need to make -30-V supply.

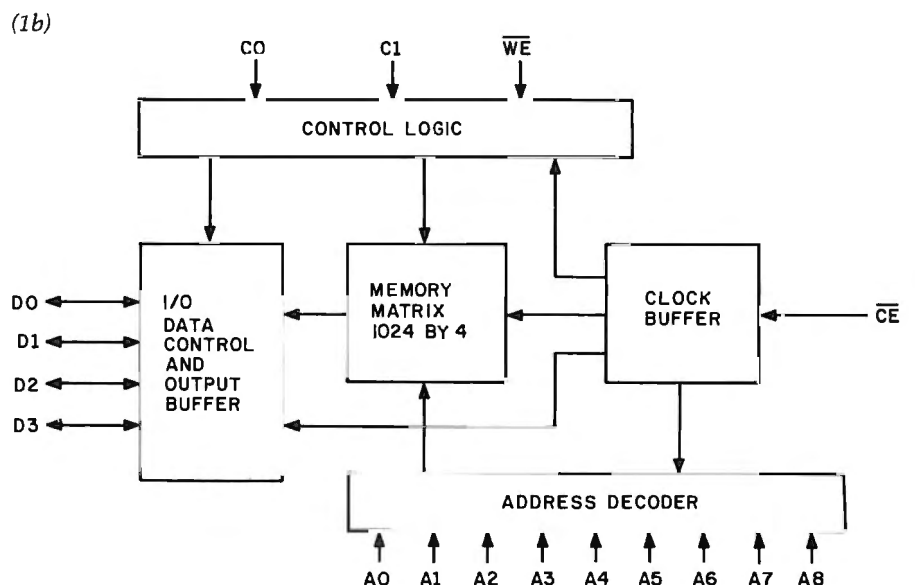

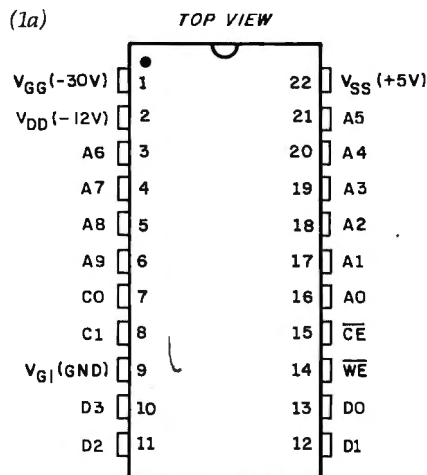

Unlike a regular programmable memory which has only read and write functions, the ER3400 has four operational modes: read; write; word erase; and block erase.

Operational Modes of the ER3400

Erase: To erase one word, both of the C0 and C1 mode-control input lines are set in the logic 1 (high) state, and the desired address location is set. A negative excursion of the voltage on the chip enable (\overline{CE}) line loads in the address and control, and initiates the erase operation. To avoid tying up the microprocessor bus, this mode is latched on the positive-going edge of the \overline{CE} signal. The erase operation will continue while \overline{CE} is high.

When it is desired to erase the entire device, the operation is the same,

Figure 1: Pinout designations of the twenty-two pins on the General Instrument ER3400 electrically alterable read-only memory (1a), and a block diagram of the major circuit sections within the part (1b).

Color. VP-590 add-on Color Board allows program control of 8 brilliant colors for graphics, color games. Plus 4 selectable background colors. Includes sockets for 2 auxiliary keypads (VP-580). \$69*

Sound. VP-595 Simple Sound Board provides 256 tone frequencies. Great for supplementing graphics with sound effects or music. Set tone and duration with easy instructions. \$24*

Music. VP-550 Super Sound Board turns your VIP into a music synthesizer. 2 sound channels. Program control of frequency, time and amplitude envelope (voice) independently in each channel. Program directly from sheet music! Sync provision for controlling multiple VIPs, multitrack recording or other synthesizers. \$49*

Memory. VP-570 RAM Expansion Board adds 4K bytes of memory. Jumper locates RAM in any 4K block of up to 32K of memory. On-board memory protect switch. \$95*

EPROM Programmer. VP-565 EPROM Programmer Board comes complete with software to program, copy and verify 5-volt 2716 EPROMs—comparable to units costing much more than the VP-565 and VIP put together! Programming voltages generated on board. ZIF PROM socket included. \$99*

EPROM Interface. VP-560 EPROM Interface Board locates two 5-volt 2716 EPROMs (4K bytes total) anywhere in 32K of memory. VIP RAM can be re-allocated. \$34*

ASCII Keyboard.** Fully encoded, 128-character ASCII encoded alpha-numeric keyboard. 58 light touch keys including 2 user defined keys! Selectable upper and lower case. Handsomely styled. Under \$50*

Tiny BASIC.** VP-700 Expanded Tiny BASIC Board puts this high-level language on your VIP. BASIC stored in 4K of ROM. Ready for immediate use—no loading necessary. This expanded BASIC includes the standard Tiny BASIC commands plus 12 additional—including color and sound control! Requires external ASCII encoded alpha-numeric keyboard. \$39*

Auxiliary Keypads. Program your VIP for 2-player interaction games! 16-key keypad VP-580 with cable (\$15*) connects to sockets provided on VP-590 Color Board or VP 585 Keyboard Interface Card (\$10*).

COSMAC VIP lets you add computer power a board at a time.

With these new easy-to-buy options, the versatile RCA COSMAC VIP (CDP18S711) means even more excitement. More challenges in graphics, games and control functions. For everyone, from youngster to serious hobbyist. And the basic VIP computer system starts at just \$249* assembled and ready to operate.

Simple but powerful—not just a toy.

Built around an RCA COSMAC micro-processor, the VIP includes 2K of RAM. ROM monitor. Audio tone with a built-in speaker. Plus 8-bit input and 8-bit output port to interface relays, sensors or other peripherals. It's

easy to program and operate. Powerful CHIP-8 interpretive language gets you into programming the first evening. Complete documentation provided.

Take the first step now.

Check your local computer store or electronics parts house. Or contact

RCA VIP Marketing, New Holland Avenue, Lancaster, PA 17604. Phone (717) 291-5848.

*Suggested retail price. CDP18S711 does not include video monitor or cassette recorder.
**Available 1st Quarter, 1979.

The fun way
into computers.

RCA

C0	C1	Mode	Explanation
0	1	Block erase	Erase operation performed on all words.
1	1	Word erase	Stored data is erased at addressed location.
0	0	Read	Addresses data read after leading edge of \overline{CE} pulse.
1	0	Write	Input data written at addressed location.

Table 2: Selection of modes of operation of the ER3400 EAROM. The indicated logic levels are presented to the two mode-control inputs C0 and C1 to produce the corresponding mode of operation of the memory device.

except that the C0 mode-control input is low while C1 is kept in a high logic state.

A "dummy read" operation is required to end the erase cycle.

Write: The control code for write is for the C0 line to be high while C1 is low. The control word and address are strobed in at the occurrence of the \overline{CE} (chip enable) pulse. Data is strobed in during the write enable (\overline{WE}) signal. The timing requirements for the write enable signal are design-

ed so that \overline{WE} may be generated by combining the chip enable signal and a write signal through a logic gate.

As is the case with the erase operation, the control code and address are latched on the rising (positive-going) edge of \overline{CE} . Data is latched by the rising edge of \overline{WE} . As in erase, a dummy read is required to end the write cycle.

Read: To read out data, C0 and C1 control lines are both held low and the desired address is selected. The

chip enable signal strobes in the mode and address data, and clocks out the data.

In all modes, when \overline{CE} is high, the data input/output lines are in a high-impedance state. The control line logic levels for the several modes are summarized in table 2.

In the write and erase (both word and bulk) modes, the data, addresses, and the state of the control lines are loaded into internal registers within the ER3400 on the rising edge of the \overline{CE} pulse, and are later cleared by a dummy read pulse also strobed by \overline{CE} .

Number	Type	+5 V	GND	-12 V	-30 V
IC1	HM-7603	16	8		
IC2	ER3400	22	9	2	1
IC3	ER3400	22	9	2	1
IC4	74121	14	7		
IC5	7400	14	7		

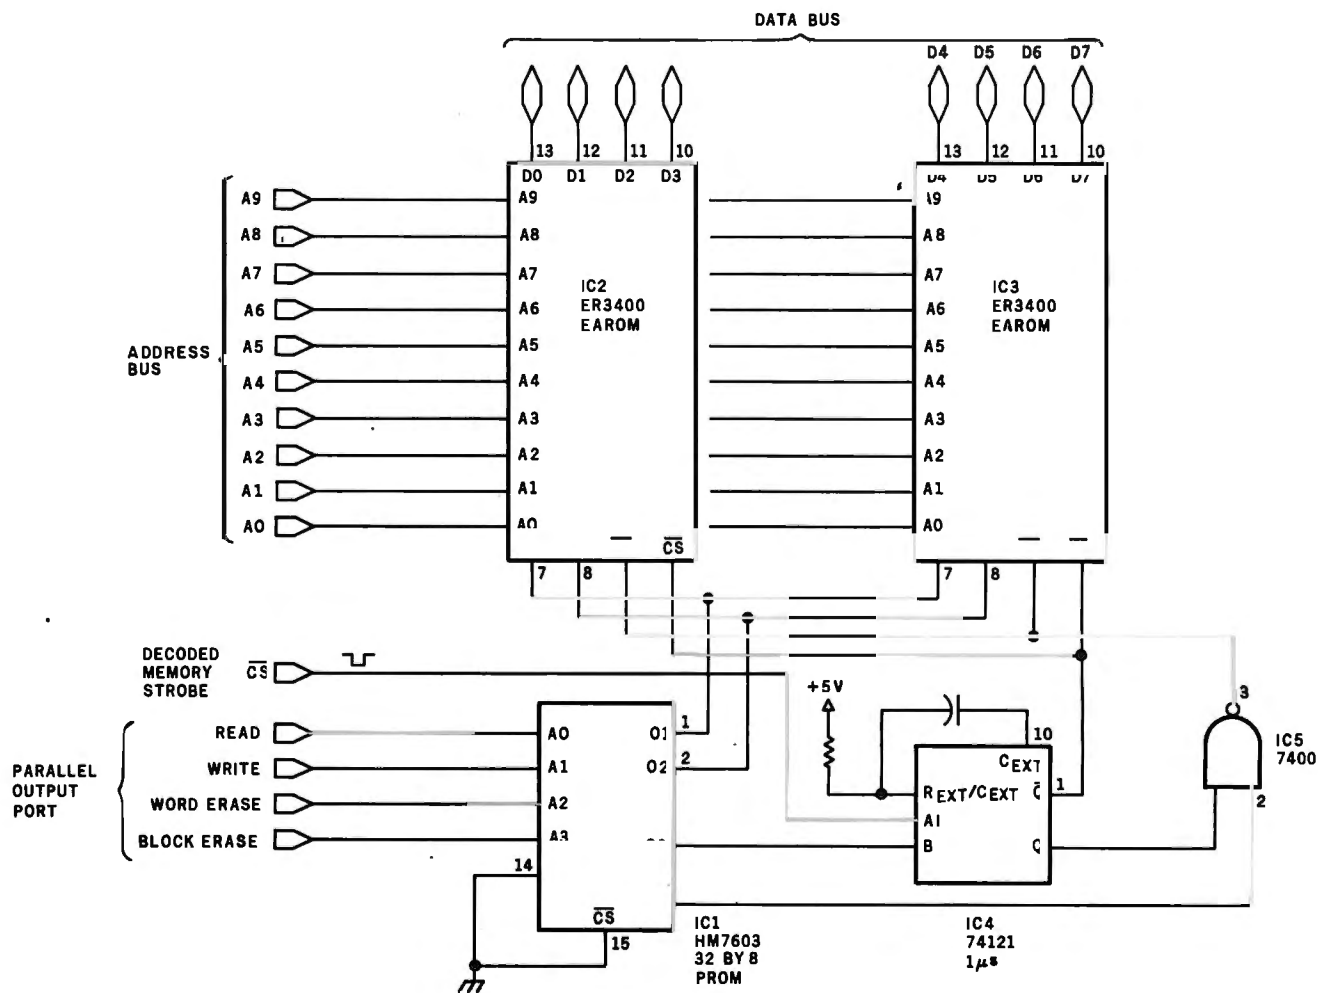

Figure 2: Schematic diagram of a circuit that uses two ER3400s to form a 1024-byte memory. Read, write, and erase functions of the ER3400 are available using this circuit. The programmable read-only memory, IC1—the Harris Semiconductor HM-7603, a 32-word-by-8-bit PROM, serves to decode mode-control inputs received from a parallel output port. The truth table for this PROM is shown in table 3.

We Need Your Help!

An International Company Called MicroDaSys has designed a dynamite solution for the small businessman seeking a computer. We call it the "millie"TM. It's a system that combines the **absolute best business software available** with **fast, dependable hardware**.

The "millie" is the smartest buy a small business can make. It comes with the most powerful **accounting, word processing and applications software** available. And to take advantage of that power, the "millie" uses the S-100 bus, eight inch disk drives and the universal CP/M[†] operating system. It can be programmed in BASIC, FORTRAN, Pascal and dozens of other languages. Best of all, "millie" prices start at **under \$3000**. The one illustrated includes a **reproduction-quality printer and full accounting and word processing software** for just \$6995. "Millie" has been in use for over a year in the US, Europe, South America and Australia. It is a **proven design**, regularly updated as the state-of-the-art advances.

But an international company can't knock on doors. Without branch offices in every city of the US (and the world) we have the same problem as dozens of other computer manufacturers. **We simply can't contact all of the small businessmen who could benefit from our "millie"**. That's where you come in.

We seek your help. Sell our "millie" as a complete, integrated system to your **neighborhood businesses, universities, writers and other professionals**. If you're reading this magazine you probably

have all the expertise required to demonstrate and sell "millies". All that's really required is the **motivation to seek out prospective customers** and the **ability to present "millie's" features** to them in a way most understandable to them. **Put us in your customer's place.**

We offer you a piece of the exciting computer market, the chance to work with the most sophisticated software and hardware available, and best of all, a **handsome commission** and **no minimum purchase requirements** (not even one!).

It's easy to sell "millies". You will be supported by an **international advertising campaign**, a **dependable system** made by a **well known manufacturer**, and the **best documentation** available. All you need is the enterprise to **seek out new customers** and **provide them with the support they need** (perhaps earning your own consulting fees) **during and after installation**. We will even supply you with **potential sales leads in your area** — Reader Service Questionnaires, Direct Mail Inquiries, and Telephone Responses. These are people who **want you to sell them a "millie"**! All you need to do is **act!**

You've got nothing to lose! There are absolutely **no strings, no minimum purchases, no special degrees or instruction required, no retail store necessary**. All that is required is the sincere desire to earn money selling our computers. Join the fascinating field of computer sales **now**. **The market is ready if you are!** Write or call today for your **introductory sales package and complete info.**

millie

All other locations						0	0	0	0	X	X	X	X

Table 3: Truth table for the mode-decoding, programmable read-only memory (PROM) that appears as IC1 in figure 2. A high logic state is represented by 1; a low logic state is represented by 0. Where the logic state does not matter, X characters appear in the table. Possible substitutes for the Harris Semiconductor HM-7603 PROM used here include the 74S288, 82S123, and AM27S09.

Observe carefully the requirement for the dummy read operation. Since there is no internal timing or sequencing, the ER3400 relies upon the user to terminate the write and erase functions by switching the EAROM into the read mode after 1 ms following a write and after 10 ms following an erase. There are various software and hardware methods to accomplish this.

For personal computer use, the circuit of figure 2 should be considered.

A parallel output port provides the flag input to the mode-decoding, programmable read-only memory (PROM) IC1. A memory map of the mode-decoding memory is shown in table 3.

With the electrically alterable read-only-memory device attached to the address and data lines, a read operation is accomplished by setting the output bit corresponding to the A0 input line of the PROM to a high logic state. Each of the four address

lines A0 thru A3 is called a flag for purposes of explanation.

Setting the read flag (A0) corresponds to a binary 10000 input code to the PROM (IC1 in figure 2). The O1 and O2 outputs will place low logic levels on both mode-control inputs C0 and C1. This places the EAROM in the read mode.

Next, the EAROM is addressed through the normal \overline{CS} line. This action fires the one-shot (monostable multivibrator, IC4 in figure 2) which clocks the data onto the computer data bus. The ER3400 has a cycle time of 1.8 μ s. Depending upon the memory speed of your computer, it may be necessary to add wait states when addressing EAROM.

The sequence is similar for write and erase operations. By setting the write flag (A1), the mode-decoding PROM causes C0 to go high while C1 stays low, placing the EAROM in the write mode. Addressing the appropriate byte and strobing the \overline{CS} line causes the ER3400 to enter a write

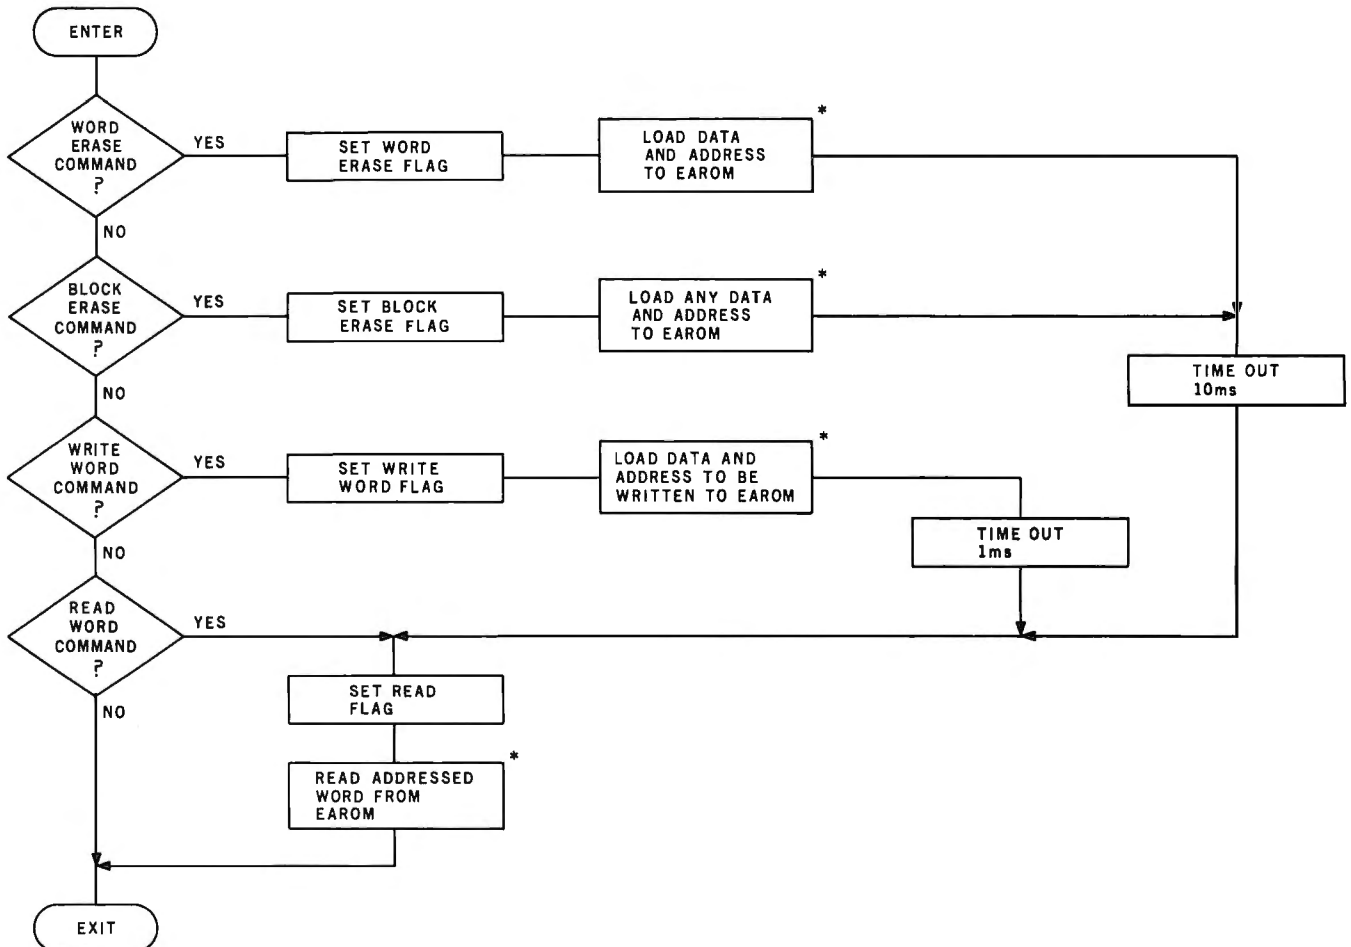

Figure 3: A flowchart of the algorithm for actuating the various operating modes of the ER3400 interface circuit of figure 2. The diagram blocks marked with asterisks refer to standard memory read or write instructions.

CCS has everything to expand your Apple II*

Friendly Frankie's roadside Apple II stand has plenty to whet your appetite for expansion. So, if you're ready to have your Apple II computer interface with the outside world, wheel around to Frankie's stand today.

Expand to your heart's content with our full range of delicious

accessories, including: prom modules, asynchronous and synchronous serial interfaces, arithmetic processors, programmable timers, parallel interfaces, A/D converters, and Apple II compatible boards galore.

Let Frankie connect your Apple II to the rest of the world

faster, and for a lot less bucks.

For all the mouth-watering details, contact our northern California headquarters or your local roadside computer store. If Frankie's out, ask for Dennis or Jerry. They'll be glad to help you.

Table 4: Descriptions of pin functions of the General Instrument ER1711 hybrid EAROM/programmable memory part.

Pin	Description
D0 thru D3	4-bit data word
A0 thru A7	8-bit data address
V _{SS}	+ 5-V supply voltage
V _{DD}	- 12-V supply voltage
V _{GI}	Ground
CE	Chip enable: strobed during programmable-memory cycles, held low during EAROM cycles
H	Hold: normally high, low during data-recall cycle
W	Write: high during programmable-memory write cycle
RS	Restore: normally low, pulsed high during recall cycle
E/W	Erase/Write: controls EAROM memory cells.

condition. (The byte addressed for writing should have previously been erased through either the word or block erase operations.)

After 1 ms, the read flag (A0) is set and a read sequence is executed to stop the write activity. A flowchart of the mode-selection algorithm is shown in figure 3.

Operational Modes of the ER1711

The ER1711 operates quite differently from the ER3400. Configured as 256 by 4 bits, this device combines the properties of both regular pro-

grammable memory and electrically alterable read-only memory on a single chip. Figure 4 shows the pinouts of the ER1711, and table 4 describes the pin functions.

In general, EAROM writing is rather slow. Read access time can be less than 1 ms, but writing and erasing take 1 to 50 ms (depending upon the device). As demonstrated earlier, it takes a little over 1 second to completely write the ER3400.

In applications where the EAROM is "read-mostly" memory and is used to hold infrequently changing data or

Figure 4: Pinout designations of the General Instrument ER1711 hybrid electrically alterable read-only-memory/programmable-memory device.

programs, slow erase and write times are no problem. However, in instances where an EAROM is used to store data or programs during power-down conditions, slow write times are objectionable. The distinctive feature of the ER1711 is its ability to store its entire contents of the programmable memory in a single write pulse.

The static programmable-memory section of the ER1711 is addressed like any other system memory. It can hold constantly changing data with no restrictions on the number of read/write cycles. The contents of this memory can be transferred to the EAROM section through one write pulse. In this way, the EAROM can instantly save all data when the power fails. When power is returned, a simple pulse sequence restores the data from the EAROM to the programmable operating memory.

ER1711 Power Requirements

The ER1711 uses +5-V and -12-V power supplies for normal programmable-memory operation. These supplies must be kept constant within a 5% tolerance. Other voltages used are as follows for EAROM operations:

$$V_w (-17 \text{ V to } -21 \text{ V})$$

is used to transfer data from programmable memory to EAROM;

$$V_R (-8 \text{ V to } -15 \text{ V})$$

is used to transfer data from EAROM to programmable memory; and

$$V_E (+25 \text{ V to } +30 \text{ V})$$

TURN-ON!

Now have full computer control of up to 256 lights, appliances and even wall switches **without special wiring**. The SciTronics REMOTE CONTROLLER permits direct control of the inexpensive BSR remote line-carrier switches sold by Sears, Radio Shack and many others.

HOW IT WORKS: Writing 3 control words to the controller board sends one of 6 instructions over the a-c line to the desired switch. The instructions include any remote on, off, all off, any light bright, dim, or all on. Reading the board tells if busy.

FEATURES:

- ★ FULL S-100 COMPATIBILITY—all lines fully buffered, board address dip switch selectable to span 65K.
- ★ FULL TRS-80-1 COMPATIBILITY—board housed in attractive woodgrained case with power supply and connector cable allows direct connection to TRS-80-I expansion port.
- ★ COMPATIBLE WITH OTHER SYSTEMS—combination of on-board select switches and complete connector wiring information allows ease of use with Apple II, PET, KIM, SYM, HEATH H8, plus others.
- ★ SYSTEM SELECT SWITCHES—choose active high or low inputs, addressed or I/O drive, parallel or serial entry, non S-100 inputs like VMA, clocking on any transition.
- ★ SIMPLE TO USE—sample software included for all systems listed, all IC's socketed.

APPLICATIONS:

- ★ Make your entire home, business or apartment "computer controlled"
- ★ Save energy by controlling lights and appliances
- ★ Control lights and alarms for security systems

REMOTE CONTROLLER BOARD \$159.

ENCASED SELF POWERED CONTROLLER FOR TRS-80-I \$184.

remote switches not included

From PERCOM

One-Drive System:

\$399. (40-track) & \$675. (77-track)

Two-Drive System:

\$795. (40-track drives) & \$1350. (77-track drives)

Three-Drive System:

\$1195. (40-track drives) & \$2025. (77-track drives)

Requires Expansion Interface, Level II BASIC & 16K RAM.

Low Cost Add-On Storage for Your TRS-80* . In the Size You Want.

When you're ready for add-on disk storage, we're ready for you.
Ready with six mini-disk storage systems — 102K bytes to 591K bytes of
additional *on-line* storage for your TRS-80* .

- Choose either 40-track TFD-100™ drives or 77-track TFD-200™ drives.
- One-, two- and three-drive systems immediately available.
- Systems include Percom PATCH PAK #1™, on disk, at no extra charge. PATCH PAK #1™ de-glitches and upgrades TRSDOS* for 40- and 77-track operation.
- TFD-100™ drives accommodate "flippy disks." Store 205K bytes per mini-disk.
- Low prices. A single-drive TFD-100™ costs just \$399. Price includes PATCH PAK #1™ disk.
- Enclosures are finished in system-compatible "Tandy-silver" enamel.

Whether you need a single, 40-track TFD-100™ add-on or a three-drive add-on with 77-track TFD-200™s, you get more data storage for less money from Percom.

Our TFD-100™ drive, for example, lets you store 102.4K bytes of data on one side of a disk — compared to 80K bytes on a TRS-80* mini-disk drive - and 102.4K bytes on the other side, too. Something you can't do with a TRS-80* drive. That's almost 205K bytes per mini-disk.

And the TFD-200™ drives provide 197K bytes of on-line storage per drive

— 197K, 394K and 591K bytes for one-, two and three-drive systems.

PATCH PAK #1™, our upgrade program for your TRSDOS*, not only extends TRSDOS* to accommodate 40- and 77-track drives, it enhances TRSDOS* in other ways as well. PATCH PAK #1™ is supplied with each drive system at no additional charge.

The reason you get more for less from Percom is simple. Peripherals are not a sideline at Percom. Selling disk systems and other peripherals is our main business — the reason you get more engineering, more reliability and more back up support for less money.

In the Product Development Queue . . . a printer interface for using your TRS-80* with any serial printer, and . . . the *Electric Crayon*™ to map your computer memory onto your color TV screen — for games, animated shows, business displays, graphs, etc. Coming PDQ!

™ TFD-100, TFD-200, PATCH PAK and Electric Crayon are trademarks of PERCOM DATA COMPANY.

*TRS-80 and TRSDOS are trademarks of Tandy Corporation and Radio Shack which have no relationship to PERCOM DATA COMPANY.

To order add-on mini-disk storage for your TRS-80* , or request additional literature, call Percom's toll-free number: 1-800-527-1592. For detailed Technical information call (214) 272-3421.

Orders may be paid by check or money order, or charged to Visa or Master Charge credit accounts. Texas residents must add 5% sales tax.

Percom '*peripherals for personal computing*'

is used for erasing the EAROM storage cells.

Since these voltages are required only as single pulses during either power-up or power-down cycles, they do not require separate power supplies. All voltages can be generated by charge-pumping circuits operated from +5-V and -12-V supplies.

Figure 5 is the schematic diagram of a circuit which accomplishes the save-data and recall-data functions and maintains the proper timing and voltages required for the various operations.

Data Restoration

The static-programmable-memory portion of the ER1711 has an access time of 900 ns. Upon initial application of power to the system, if this programmable memory is to be loaded from EAROM, the computer signals this action by pulsing the *data-recall* input line. This triggers a 300 μ s ramped voltage to the erase/write (E/W) line of the ER1711. After 300 μ s, the hold line (H) is

brought high for 150 ms, and the E/W line is set at a potential of 27 V. At the conclusion of this sequence, the ER1711's programmable memory will contain the former contents of the EAROM, and the EAROM will be erased.

Saving the data stored in the programmable memory is started by raising the *system-save* line to a logic 1. The resultant application of a -20-V pulse of a 1-to-10-ms duration to the ER1711 causes the data to be stored in the electrically alterable read-only memory. Data retention time varies according to the pulse duration, from 3 days for a 1-ms pulse to 30 days for a 10-ms pulse.

In Conclusion

I do not expect that you will immediately convert your computer memory to EAROM, but at least you now know what EAROM is. In my own case, I have chosen to use ER1711 memory devices for my automotive computer. I can only speculate on the final configuration, but at least I can count on not having

Figure 5: A circuit that allows data stored in the programmable memory of the ER1711 to be saved into and recalled from the electrically alterable read-only-memory section. Charge-pumping circuits are used to generate the relatively high voltages needed for the erase, store, and recall cycles of the ER1711. Power-down and power-up states are initiated by the System Save and Data Recall signals. 

to be concerned with standby power consumption and battery backup.

For further information on EAROMs or determination of price and availability contact:

Next Month: you will learn how to build a wireless interface that connects the Sears (alias BSR) home control system to your computer. ■

Operation of the ER1711

In normal operation the ER1711 operates as a programmable memory. Before powering down, the data can be stored in the electrically alterable, nonvolatile read-only-memory (EAROM) cells by a single, negative write pulse. When power is restored, the previously saved data can be recalled by a power-up and data-recall cycle which transfers all this saved data to the programmable memory. It is suggested that an erase cycle be performed soon after the data-recall cycle, so that the memory will be prepared in case of another power-down cycle. The EAROM cycles operate as explained here.

Erase Cycle:

1. The H line should be high and the RS and CE lines low.
2. Positively pulse the E/W line to +25 V for 100 to 200 ms.

Stored-Data Cycle:

1. The H line should be held high

and the RS and CE lines low.

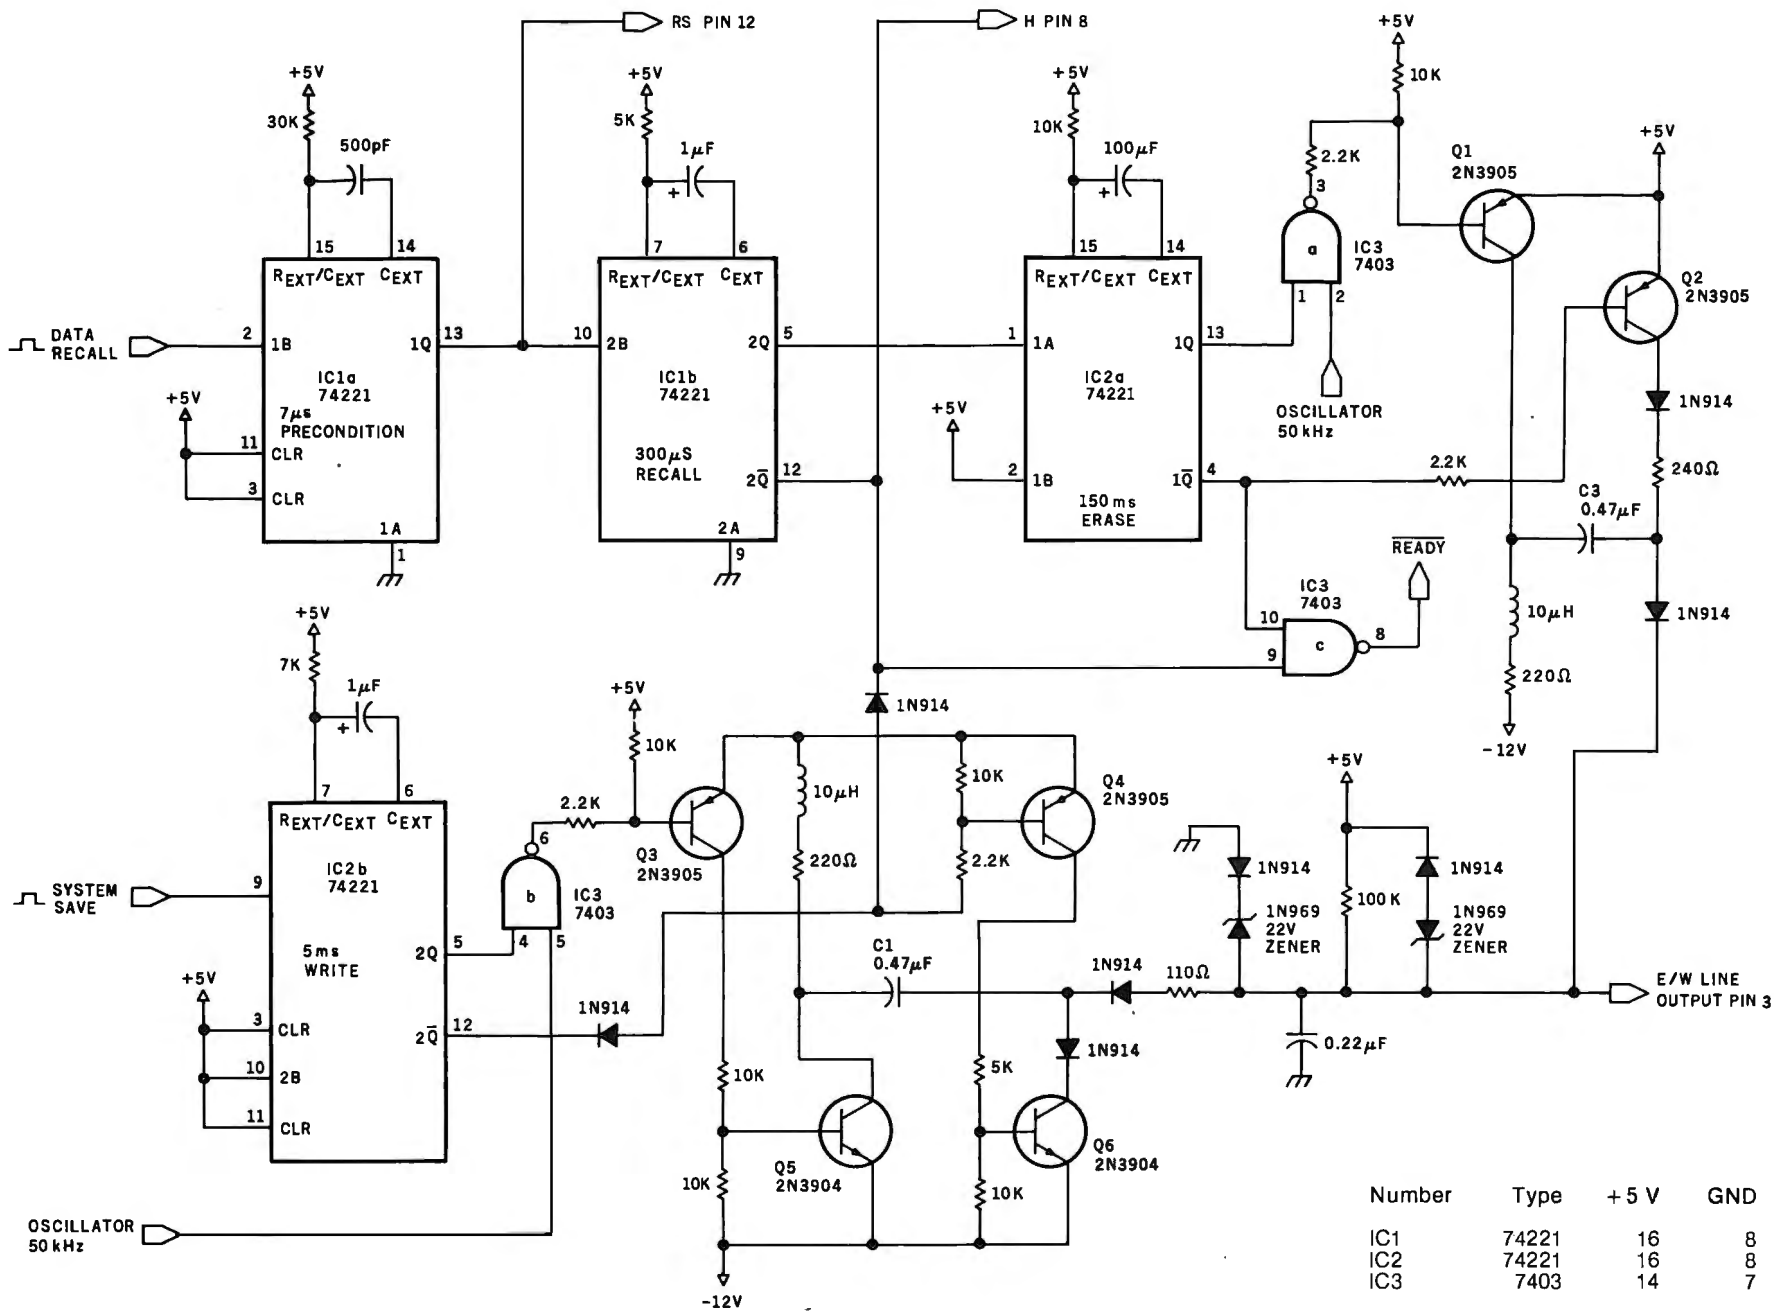

2. Pulse the E/W line negative to -22 V for 1 to 10 ms to store nonvolatile data.
3. The nonvolatile EAROM memory cells must have been previously erased for valid data retention.

Power-Up and Recall Cycle:

1. Turn on power with CE and RS held to ground and the H and E/W lines biased to V_{SS} .
2. When power is on, lower H and pulse RS to precondition the EAROM cells.
3. Lower RS and ramp down the E/W line at a rate of -0.1 V/ μ s. This can be done with a series resistor of 470 K ohms in the E/W line.
4. After the E/W recovery time, bring both the E/W and H lines to + V_{SS} .
5. If in the course of erasing data, the power shuts down again, the erase cycle can be terminated and a write cycle im-

mediately started without loss of data.

In normal programmable-memory operation, only the +5-V and -12-V power supplies are required. The erase-store and recall cycles require momentary high-voltage pulses to tunnel charges through the negative-metallic-oxide-semiconductor (NMOS) memory transistors. These higher voltages can be created from the +5-V and -12-V power supplies using the charge-pumping circuits shown in figure 5. This circuit will generate the sequence of RS, H and E/W pulses needed for power-down and up sequencing. The power-down and up cycles are initiated by System Save and Data Recall signals respectively. Figure 5 is a suggested circuit using standard transistor-transistor logic (TTL) parts; a similar circuit can be designed with complementary-metallic-oxide-semiconductor (CMOS) logic instead.

Faster Audio Processing with a Microprocessor

William J Dally
Apt U-3 Dutch Village
Blacksburg VA 24060

Introduction

Audio processing involves transforming an audio signal by filtering, delay, and modulation to make the sounds more musically pleasing or to improve communication systems. Audio processing by both analog and digital methods has been performed for many years; however, these methods are expensive to implement if complete manipulation of the output signal is to be achieved.

The advent of low-cost microcomputers in recent years permits a new approach to audio processor design which has the advantage of much greater flexibility at competitive costs. T C O'Haver employed a microcomputer for audio processing using a minimum of hardware in the design, while relying upon software for signal manipulation (see "Audio Processing with a Microcomputer," June 1978 BYTE, pages 166 thru 173). With this heavy emphasis on software, the speed of the processor was not sufficient to process high fidelity audio signals (20 Hz to 20 kHz). This

article presents a different approach wherein modest amounts of hardware are incorporated into the design of the microcomputer system, reducing the demands on the processor. Flexibility in manipulating the audio signal is not sacrificed, and the cost of the additional hardware is not excessive.

Timing Analysis of Software Approach

In the microcomputer audio processing system developed by O'Haver, only an analog-to-digital (A/D) converter, a microprocessor, and a digital-to-analog (D/A) converter were used. The audio processing functions of phlanging, reverberation, and linear transformation were performed by the software of the system. In a timing analysis of the design, an 8080 processor operating at a system clock rate of 2 MHz was considered.

The processing routines used in this system are shown in listing 1, translated to 8080 assembly language. Also shown are the number of processor cycles and the execution times for these routines (28 μ s, 79 μ s, and 85 μ s respectively). Most applications will use all three of these routines, as well as system control and overhead routines. Thus, the worst-case cycle time (the time required to process one unit of data) becomes:

$$t_{cy} = 28 + 79 + 85 + t_{ov} > 200 \mu s$$

where t_{cy} = worst-case cycle time
and t_{ov} = overhead time.

To prevent distortion, the sampling frequency f_s must be twice that of the maximum signal frequency f_x which is:

$$f_s < f_x / 2 = 1 / (2t_{cy}) < 2.5 \text{ kHz.}$$

It is evident from this calculation that $f_s < 2.5$ kHz is too low for high-fidelity audio. Furthermore, many audio applications require more functions than linear transformation, phlanging, and reverberation. Adding more functions to a software-oriented system decreases the maximum signal frequency still further. It is apparent that a system which depends too heavily on software is too slow for comprehensive audio processing. A better approach is to use a design combining software and hardware that reduces the time demands on the processor, while maintaining flexibility.

Hardware and Software Approach

There are several methods by which hardware can be added to the system to reduce the processing load. Bit-slice processors with cycle times which are about eight times faster than an 8080 could be used for the processor. However, these bit-slice processors and the fast memories needed to support them are prohibitively expensive. Also, this system would not be capable of handling any additional functions.

A better solution is to add peripheral hardware to take some of the processing load off of the pro-

About the Author

William J Dally is an engineering consultant for a Silver Spring, Maryland electronics development firm and is an electrical engineering student at Virginia Polytechnic Institute and State University. His past projects include a programmable read-only memory programmer, a computerized traffic control system, and an intelligent tape drive; current projects include a general purpose Z80 system and a disk-based editor plus assembler which uses only 3 K bytes of memory.

MOVING DATA AT A SNAIL'S PACE BECAUSE YOU'RE FLOPPY BOUND?

Let Corvus Systems put you back in the race!

- For TRS-80†, Apple‡ (including Apple Pascal), S-100 Bus—and now LSI-11.
- Fully compatible hardware/software.
- 10-million byte disk: IMI-7710.
- Proven Winchester technology.
- Z-80 based Corvus disk controller.
- Comprehensive disk diagnostics.
- Up to 4 disks per system.
- System \$5350, add-on disk \$2990.

Corvus offers a complete systems solution to the mass storage problem of micro computers. In a package smaller than a briefcase, we provide an intelligent controller, disk, and personality module. Call or write today for additional information. Get up to speed with Corvus.

Execution times of 28 μ s (linear transformation), 79 μ s (phlanging) and 85 μ s (reverberation) are too slow for high-fidelity audio applications.

cessor. This distributed hardware approach is less expensive than a fast processor, and allows more flexible software since timing is not critical. The remainder of this article will discuss this approach.

System Definition

To design an audio processing

microcomputer system, it is necessary to define the system's processing functions. These functions fall into three categories: linear transformations, time-delay functions, and gain-control functions. Functions such as distortion and clipping, where the output depends only on the input, are linear transformation. Time-delay

functions such as phlanging, phase shifting, and reverberation, involve delaying the incoming signal and mixing signals which are delayed for different amounts of time. Gain-control functions involve varying the gain of the system to control amplitude, and include sustain, vibrato, and quantization noise reduction.

SuperBrain™

The Honor Graduate

There's been a lot of talk lately about intelligent terminals with small systems capability. And, it's always the same. The systems which make the grade in performance usually flunk the test in price. At least that was the case until the SuperBrain graduated with the highest PPR (Price/Performance Ratio) in the history of the industry.

For less than \$3,000*, SuperBrain users get exceptional performance for just a fraction of what they'd expect to pay. Standard features include: two dual-density mini-floppies with 320K bytes of disk storage, up to 64K of RAM to handle even the most sophisticated programs, a CP/M Disk Operating System with a high-powered text editor, as-

sembler and debugger. And, with SuperBrain's S-100 bus adapter, you can even add a 10 megabyte disk!

More than an intelligent terminal, the SuperBrain outperforms many other systems costing three to five times as much. Endowed with a hefty amount of available software (BASIC, FORTRAN, COBOL), the SuperBrain is ready to take on your toughest assignment. You name it! General Ledger, Accounts Receivable, Payroll, Inventory or Word Processing . . . the SuperBrain handles all of them with ease.

Your operators will praise the SuperBrain's good looks. A full ASCII keyboard with a numeric keypad and function keys. A non-glare, dynamically focused, twelve inch screen. All in an attractive desktop unit weighing less than a standard

office typewriter. Sophisticated users will acclaim SuperBrain's twin Z-80 processors which transfer data to the screen at 38 kilobaud! Interfacing a printer or modem is no problem using SuperBrain's RS-232C communications port. But best of all, you won't need a PhD in computer repair to maintain the SuperBrain. Its single board design makes servicing a snap!

So don't be fooled by all the freshman students in the small systems business. Insist on this year's honor graduate . . . the SuperBrain.

*Quantity one. Dealer inquiries invited.

Circle 180 on inquiry card.

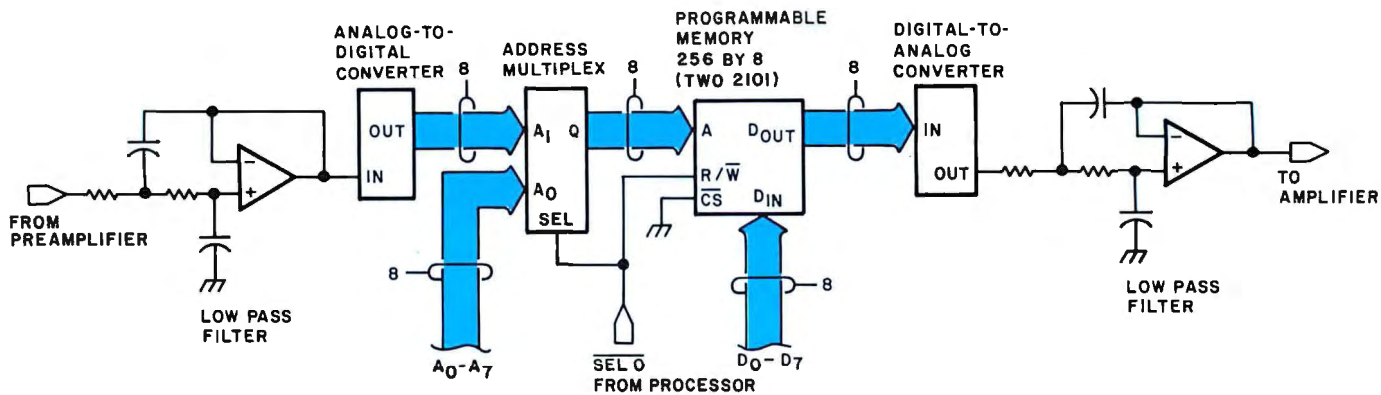

Figure 1: A simplified diagram of a hardware implementation of a linear transformation or transfer function. It requires a software routine to set up a transfer function in a look-up table stored in memory.

Linear Transformations

A simplified diagram of a hardware implementation of a linear transformation is shown in figure 1. In this system, the audio input is filtered to eliminate high-frequency noise, and converted to digital form. This digital signal is then used as the address for a look-up table stored in memory. An address multiplexer allows the processor access to the memory to set up

or change the table. The output of this table is converted to analog form and is filtered to limit it to audio frequencies. Thus, the output is an audio signal, the voltage of which forms a one-to-one correspondence with the input voltage.

The only software required to support this hardware is a routine to set up a transfer function in the look-up table. This routine is executed only

on power-up or when the transfer function is changed. Effects such as "fuzz," and harmonic distortion can be implemented in this manner, and users can define their own transfer function. A linear transfer function can be used to bypass this processing element if desired.

Compared to a software intensive approach, the only additional hardware required to implement a linear transformation is the address multiplexer. The converters and memory for a look-up table are required even with a software-oriented approach. However, the processor has much more free processing time with a hardware and software approach since data transfer takes place without processor intervention.

NOW, FROM MOUNTAIN HARDWARE. THE 100,000 DAY CLOCK.™

Put your S-100 Computer on the clock.

A real time clock could double the utility of your computer. Time events in 100 μ S increments for up to 100,000 days (over 273 years). Program events for the same period with real time interrupts that permit pre-programmed activities to take place...without derailing on-going programs. Maintain a log of computer usage. Call up lists or appointments. Time and date printouts. Time events. An on-board battery keeps the clock running in the event of power outage.

Mountain Hardware also offers a complete line of peripheral products for many fine computers.

Available at your dealer's. Now.

Time-Delay Functions

Phlanging is a time-delay function which involves delaying the input signal from 0 to 5 ms and mixing it with the current input signal to produce the output signal. The result is that of a comb filter, attenuating the frequency which has a period twice as long as the time delay and all of its odd harmonics. The time delay is varied with time over a certain range to give a sweeping effect.

Because a musician does not always want the same phlanging effect, it is necessary to give the processor control over the phlanging parameters, which include width (the difference between the longest and shortest time delay), range (the average delay), rate (the rate at which the delay changes), and depth (the amplitude of the delayed signal).

The hardware to perform the phlanging function is shown as a

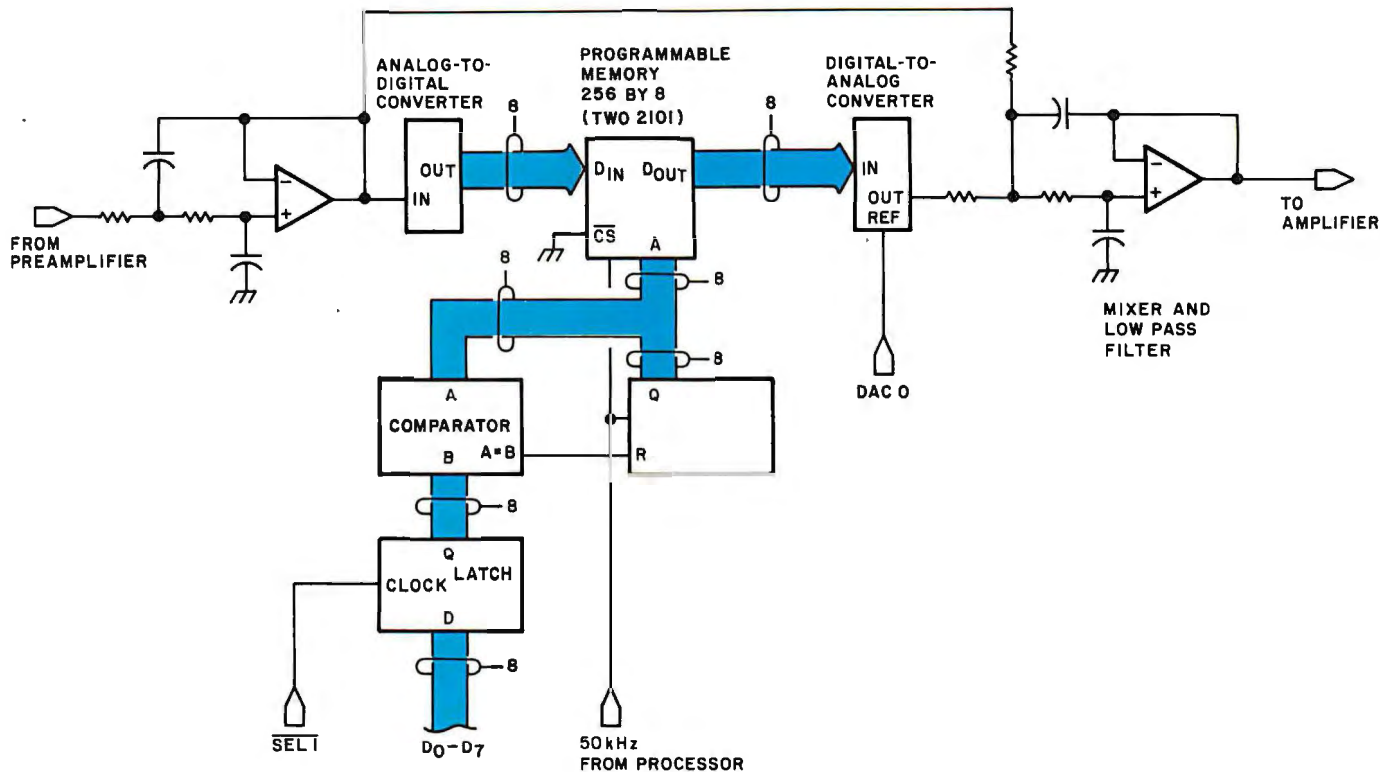

Figure 2: A diagram of hardware to perform the phlanging function. Phlanging is an audio effect originally produced by playing duplicate tape or disk recordings in almost exact synchronization. The name is derived from the practice of manipulating the phlanges of tape reels as they spin to change the degree of synchronization.

**YOU MAY ALREADY OWN
YOUR NEXT 1200 BAUD DECWRITER[®]**

**UPGRADE YOUR LA36 TO STATE-OF-THE-ART
PERFORMANCE WITH THE DS120 TERMINAL CONTROLLER**

FASTER—The DS120 prints a up to 165 cps and maintains true 1200 baud throughput. This translates into lower costs in computer time as well as time savings for you. A 1000 character internal print buffer virtually eliminates the need for fill characters.

SMARTER—Our microprocessor control "intelligently" optimizes carriage movement by printing bidirectionally and automatically executing high speed tabs over any blank spaces in the text.

MORE VERSATILE—We offer more standard features than any 1200 baud teleprinter currently available. A complete list of forms control and formatting features are programmable from the keyboard or via the data stream. The DS120 is equipped with both an EIA RS232-C interface and a 20 mA Current Loop interface. The unit communicates using the 128 character ASCII set at baud rates from 110 to 4800. Full-duplex, half-duplex and echo-plex modes may be selected from the keyboard. The controller supports half-duplex transmission using both coded-character turn-around and reverse channel protocol.

EASY TO INSTALL, EASY TO USE—The DS120 replaces your LA36 logic card in a matter of minutes and is fully compatible with the existing electronics. A comprehensive User's Manual provides detailed instructions for installation and operation.

RELIABLE—Our performance and reliability have been field proven in over 2500 installations.

INEXPENSIVE — BUT NOT CHEAP—Although the DS120 is just about the lowest cost way to print at 1200 baud, we don't cut corners on quality. The DS120 is built for years of service using pretested, high reliability components from leading manufacturers. Each unit undergoes a 48 hour test cycle before shipment and carries a 90 day warranty on materials and workmanship.

AVAILABLE - We can deliver . . . typically within 30 days after receiving your order. Our stocking distributors are conveniently located in major cities throughout the U.S. for even better delivery.

DECWRITER[®] is a registered trademark of Digital Equipment Corporation. Installation of the DS 120 voids any DEC warranty or service contract.

simplified diagram in figure 2. The input signal is filtered, converted to digital form, and stored in memory for a period of time controlled by the processor. After being delayed by storage in memory, the data is converted to analog form (with the gain controlled by the processor), then mixed with the current incoming signal, and filtered. The mixing of a delayed signal with a signal which has not been delayed produces the phlanging effect.

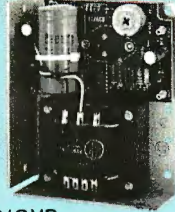

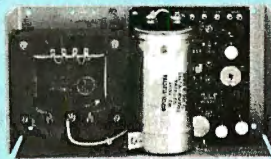

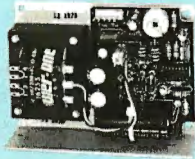

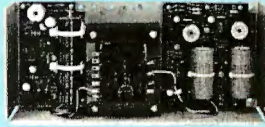

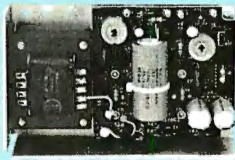

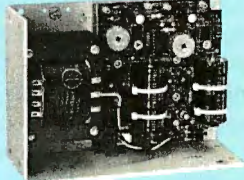

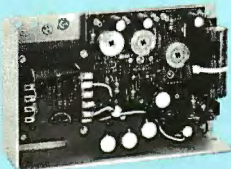

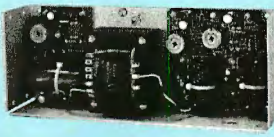

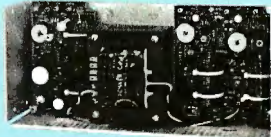

The delay in memory is accomplished by having a counter cycle through a portion of the memory, reading the delayed data and writing new data at each location. Thus, the delay is equal to the cycle length which is controlled by the processor. The processor stores the cycle length in an 8-bit latch. The contents of this latch are compared to the output of the counter; when they are equal, the counter is reset to zero. This action causes the memory to cycle from location zero to the location corresponding to the contents of the latch. Thus, the processor can add sweep to the phlanging effect, and control the width, range, and speed of the sweep by varying the contents

POWER-ONE D.C. POWER SUPPLIES

Now available for small systems applications

Power-One, the leader in quality open-frame power supplies, now offers a complete line of single, dual, and triple output models for small computer systems. Also available are special purpose models for Floppy Disk and Microcomputer applications.

Below are just a few popular examples of the over 90 "off the shelf" models now available from stock.

<p>SINGLE OUTPUT & LOGIC POWER SUPPLIES</p> <ul style="list-style-type: none"> • 56 "off the shelf" models • 2V to 250V, 0.1A to 40A • $\pm .05\%$ regulation • 115/230 VAC input 	<p>5V @ 3A, w/OVP</p>  <p>HB5-3/OVP \$24.95 single qty.</p>	<p>5V @ 12A, w/OVP</p>  <p>HD5-12/OVP \$79.95 single qty.</p>	<p>5V @ 40A, w/OVP NEW</p>  <p>SK5-40/OVP Switching Model \$250.00 single qty.</p>

of the 8-bit latch. The amplitude of the output is controlled by varying the reference voltage for the digital-to-analog converter.

A flowchart of a routine which will control the phlanging effect is shown in figure 3, and the 8080 code is shown in listing 2. This routine should be supported by a control panel routine which updates the values of amplitude, width, range, and speed from external switches.

The routine initially sets the time delay equal to range plus $\frac{1}{2}$ width. This delay is then decremented at a rate proportional to speed until the delay becomes equal to the lower limit of range minus $\frac{1}{2}$ width. When this value is reached, the process is repeated with the delay being set to its initial value.

For this routine to operate efficiently, the wait period of $(1/\text{speed})$ is regulated by a real-time clock interrupt. No processing time is wasted in software timing loops using this method. Allowing a minimum wait-time of 1 ms, this software will execute during $43 \mu\text{s}$ (average) out of every 1 ms interval. Comparing this value to the impractical execution times for a software-oriented approach, it is apparent that the addition of a little hardware takes a great load off the system software.

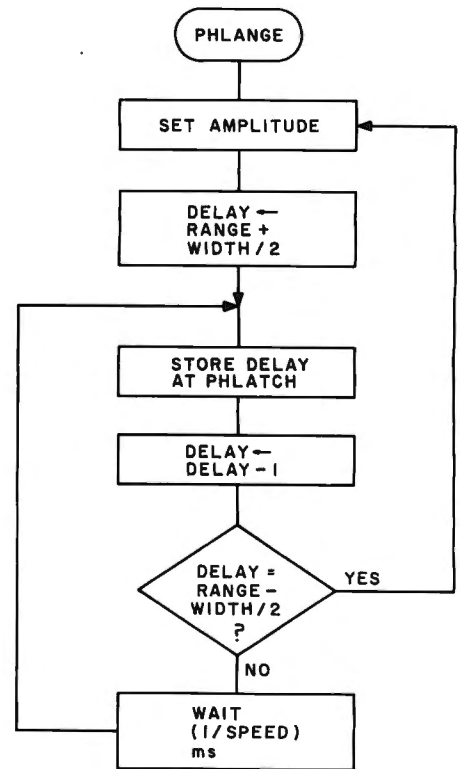

Reverberation (or reverb), another time-delay function, has the effect of making music sound like it is being played in a large auditorium. This effect is produced by creating artificial echoes, using time delay, that simulate echoes off the walls of a concert hall. Multiple echoes, from

repeated reflections off walls, are simulated by mixing the output (delayed signal) with the input (not delayed) so that the output contains information that is delayed many times. To simulate different room acoustics, it is useful for the processor to have control over the length of the delay and the amplitude of the delayed signal.

A simplified diagram of a hardware implementation of the reverberation effect is shown in figure 4. The audio input is filtered and mixed with the delayed signal, and the output of this mixer is then converted to digital form and delayed in memory using a scheme analogous to that used in phlanging, with the processor controlling the length of the delay to simulate larger or smaller rooms. The output of the delay memory is converted back to analog form, with the amplitude controlled by the processor to determine the rate at which the echoes decay. This delayed analog signal is mixed with the input, producing the reverberation effect. The output is the current input signal mixed with echoes of an integer number of time periods with decaying amplitude.

At first the circuit described by figure 4 may appear to represent more than a little additional hardware. However, the 4 K bytes of delay memory are required even with an all software approach. Furthermore, the hardware reverberation circuit provides automatic refresh for dynamic memories, as the low-order six address bits are always cycled through

Figure 3: Flowchart of software routine to control phlanging. The code for this routine is found in listing 2. It initializes the delay time to $(\text{range} + \text{width}/2)$ and decrements the time at a rate proportional to speed until the delay time is equal to $(\text{range} - \text{width}/2)$. When this value is reached, the delay time is reinitialized and the process is repeated. The average execution time is $43 \mu\text{s}$ for each cycle.

Now... You, the small systems user can enjoy the advantages of HI-performance *low cost* computer graphics

HIPLLOT™ Digital Plotters

The perfect small system output device

- Displays data in easy to read graphical format
- Both serial and parallel inputs built-in.
- Used standard 8½" x 11" paper (DIN A4)
- Plotting speed up to 2.4 ips (60 mm per sec)
- Resolution of both 0.01 and 0.005 in. (0.1 mm and 0.2 mm)
- Baud rate and step size easily changed
- Completely assembled and ready to use
- Priced at \$1085*

HIPAD™ Digitizers

The perfect small system input device

- Resolution and repeatability of 0.005 in. (0.1 mm)
- Origin is completely relocatable
- RS232C and 8 bit parallel interface selectable at the connector
- Accuracies of ±0.015 in. (0.4 mm)
- Optional LC display shows actual values being inputted
- Digitizing surface 11" x 11" (28 mm x 28 mm)
- Priced at \$795*

“onComputing™ really makes personal computers easy to understand.”

Written in non-technical language, onComputing™ contains articles on the capabilities of microcomputers, getting started, latest reviews of personal computers, where to purchase and how to use your computer.

An anyone can learn the fundamentals of using a computer. **onComputing** readers receive practical advice and helpful hints on how to get the most out of a personal computer, explanations of computer terminology, and, periodically, an updated list of active computer clubs.

Benefit from the experience of other computer enthusiasts. Articles in **onComputing** are written by well known authors as well as competent amateurs. They share their ideas on how to use the computer as a tool for business, education, home entertainment, laboratory work and other applications.

Computer experts edit **onComputing** for the new user, not the computer professional. The editors combine their esoteric knowledge of computer science and equipment to produce concise, non-technical material which can be readily understood by anyone interested in using a computer—for fun or profit.

New CRT SENSATION!

You have been reading about our astounding Pascal MICROENGINE™ CPU that executes Pascal 13x faster than an LSI-11 and 3x faster than a PDP11-34. Your orders show it! That is our Model X-90. Now meet another sensation in our X-pert Systems™ configuration. CRT Model X-920.

*Trademark Western Digital Corporation

DISPLAY/EDIT TERMINAL Model X-920

\$968*

\$856* (Without 18 function keys)

STANDARD FEATURES (partial list)

- Microprocessor controlled
- Serial RS232C and 20 ma current loop
- 10 baud rates—75 to 19,200
- 24 lines x 80 characters
- 96 ASCII displayable characters
- Upper and lower case
- 12 x 10 character resolution
- Dual intensity display
- Clear full intensity data only
- Programmable reverse video
- Programmable underline
- 105 keys with alpha lock
- 14 key numeric pad with decimal
- 16 special function keys
- 8 edit function keys
- 2 block transmission keys
- Self test mode
- Protect mode
- Block mode
- 80 storable tabbing
- Insert/delete character and line
- Scrolling
- Addressable cursor
- A host of other features, including cursor controls and remote commands such as clear to nulls, spaces, end of line, end of screen, set hi, zero intensity; set blink; etc
- **Optional** screen print & 2nd page memory

For our system or for yours, in commercial, technical, educational or personal applications, the Computex X-920 is unmatched in its price class.

Coming soon is our Model X-8000. This high performance 16-bit CPU, using the Z-8000, addresses 8M bytes of memory directly!

All features of the Hazeltine 1400 and ADM-3A

- Plus: 128 ASCII characters...
 7 x 10 matrix... Reverse video... Print key...
 Shiftlock... Transparent mode... Backspace
 Tabbing... Integrated numeric pad.

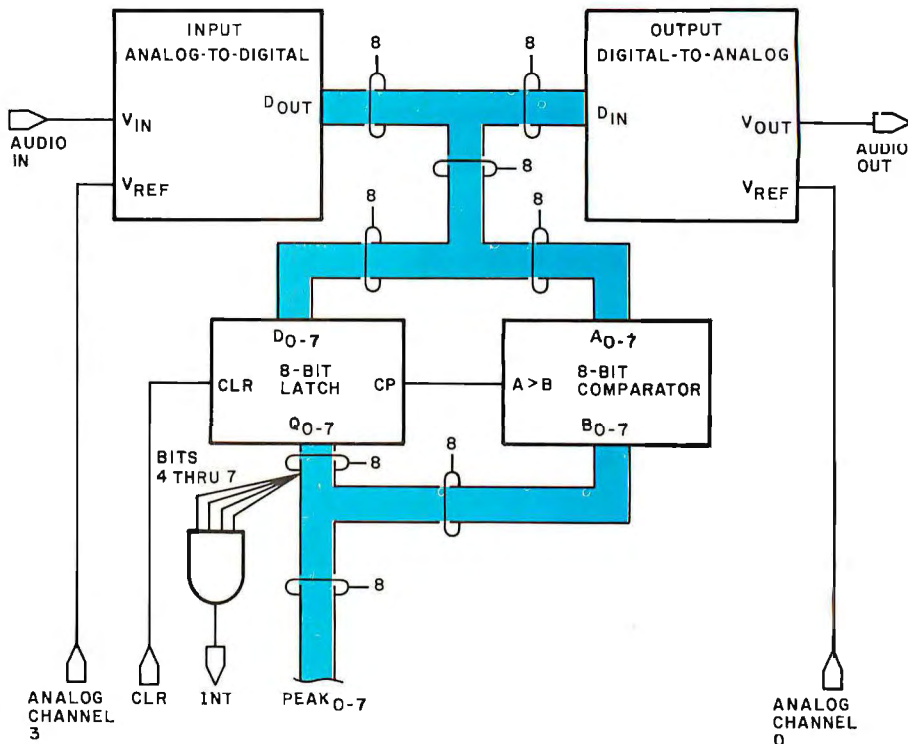

Figure 6: Simplified diagram of a gain-control function circuit. It employs a feedback system using a digital peak comparator composed of an 8-bit latch and an 8-bit comparator.

level. This effect "stretches" notes or sustains them by stopping their decay. *Vibrato* is an effect whereby the amplitude of the output is periodically varied to give a warbling sound.

The gain-control functions are implemented by means of a feedback system. The processor varies the gain of the system according to a certain rule and receives feedback on the result of its action by measuring the amplitude of the current signal. A circuit to perform these functions is shown in figure 6. The processor controls the amplitude of the signal by varying the reference voltages to the input analog-to-digital converter and output digital-to-analog converter. The processor gets feedback about the amplitude of the signal from a digital peak detector composed of an 8-bit latch and an 8-bit comparator.

To use the peak detector, the processor clears the latch at the beginning of a period and samples the contents of the latch at the end of the period. The comparator continuously compares the amplitude of the input signal (A) with the contents of the latch (B). When the amplitude of the incoming signal exceeds the value stored in the latch, the A > B output of the comparator goes to a true logic

state, strobing the amplitude of the incoming signal into the latch. Therefore the contents of the latch always reflect the greatest amplitude of the input signal from the point when the latch was last cleared, because when a signal of greater amplitude is detected by the comparator, it is clocked into the latch.

Since the attack (rising amplitude portion of waveform) of the signal may be very fast, an interrupt is provided for the processor when the amplitude exceeds hexadecimal F0. This gives the processor time to adjust gain before clipping can occur.

A flowchart and code for the compression routine are shown in figure 7 and listing 4. This compression routine attempts to keep amplitude at a constant level by subtracting the peak value of the incoming signal from a limit on this value, set by the user. The reference voltage of the input analog-to-digital converter is adjusted proportionally to the difference. Thus, if the peak amplitude is lower than the desired limit, the difference is positive, and the analog-to-digital converter reference voltage (and therefore the gain) is increased. Similarly, if the peak amplitude is greater than the limit, the gain is

Figure 7: Flowchart of a routine to perform compression of an audio signal. It adjusts the reference voltage of the input analog-to-digital converter to keep the output signal at a constant level. The assembler code for the 8080 processor is shown in listing 4.

Listing 4: 8080 assembler code of the routine to perform compression of an audio signal by adjusting the reference voltage of the input analog-to-digital converter (ADC) to keep the output signal at a constant level. The flowchart is given in figure 7.

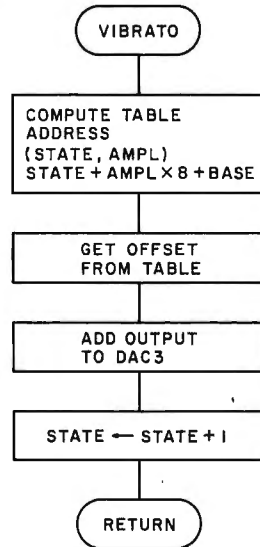

Figure 8a: Flowchart of the vibrato routine. It varies the amplitude of the audio signal in an approximately sinusoidal manner by dividing a sine wave into eight discrete parts. Each time the routine executes, it fetches an offset value from a table for the present state and amplitude. This offset value is added to the reference voltage of the input digital-to-analog converter to produce the vibrato effect. The code is given in listing 5.

decreased. This action keeps the signal at a near constant level. Reaching the maximum possible gain of the analog-to-digital converter limits this action, thereby preventing noise from being amplified to audible levels in the absence of a signal.

Vibrato is obtained by using the algorithm shown in the flowchart of figure 8a. The 8080 code is shown in listing 5. This vibrato routine varies the amplitude of the audio signal approximately sinusoidally, with a period equal to eight times the interval between executions of this routine. To simulate a sine wave, the algorithm breaks one cycle into eight parts (0 thru 7, see figure 8b). Each time the routine executes, it fetches the offset value for that part of the curve from a look-up table. Different offset values are used for different levels of vibrato. The value obtained from the look-up table is then added to the reference voltage of the input digital-to-analog converter. The frequency of the vibrato is controlled by how often the routine executes.

Figure 8b: Division of the sine wave into eight parts and the resulting voltage levels for each state.

Listing 5: Routine to add vibrato coded for the 8080 processor. It uses table look-up of an 8-segment approximation of a sine curve to vary the input digital-to-analog converter (DAC) reference voltage. Figure 8a shows the flowchart.

**A computer
is only as
good as its
software.**

MICROSOFT

We set the standard.

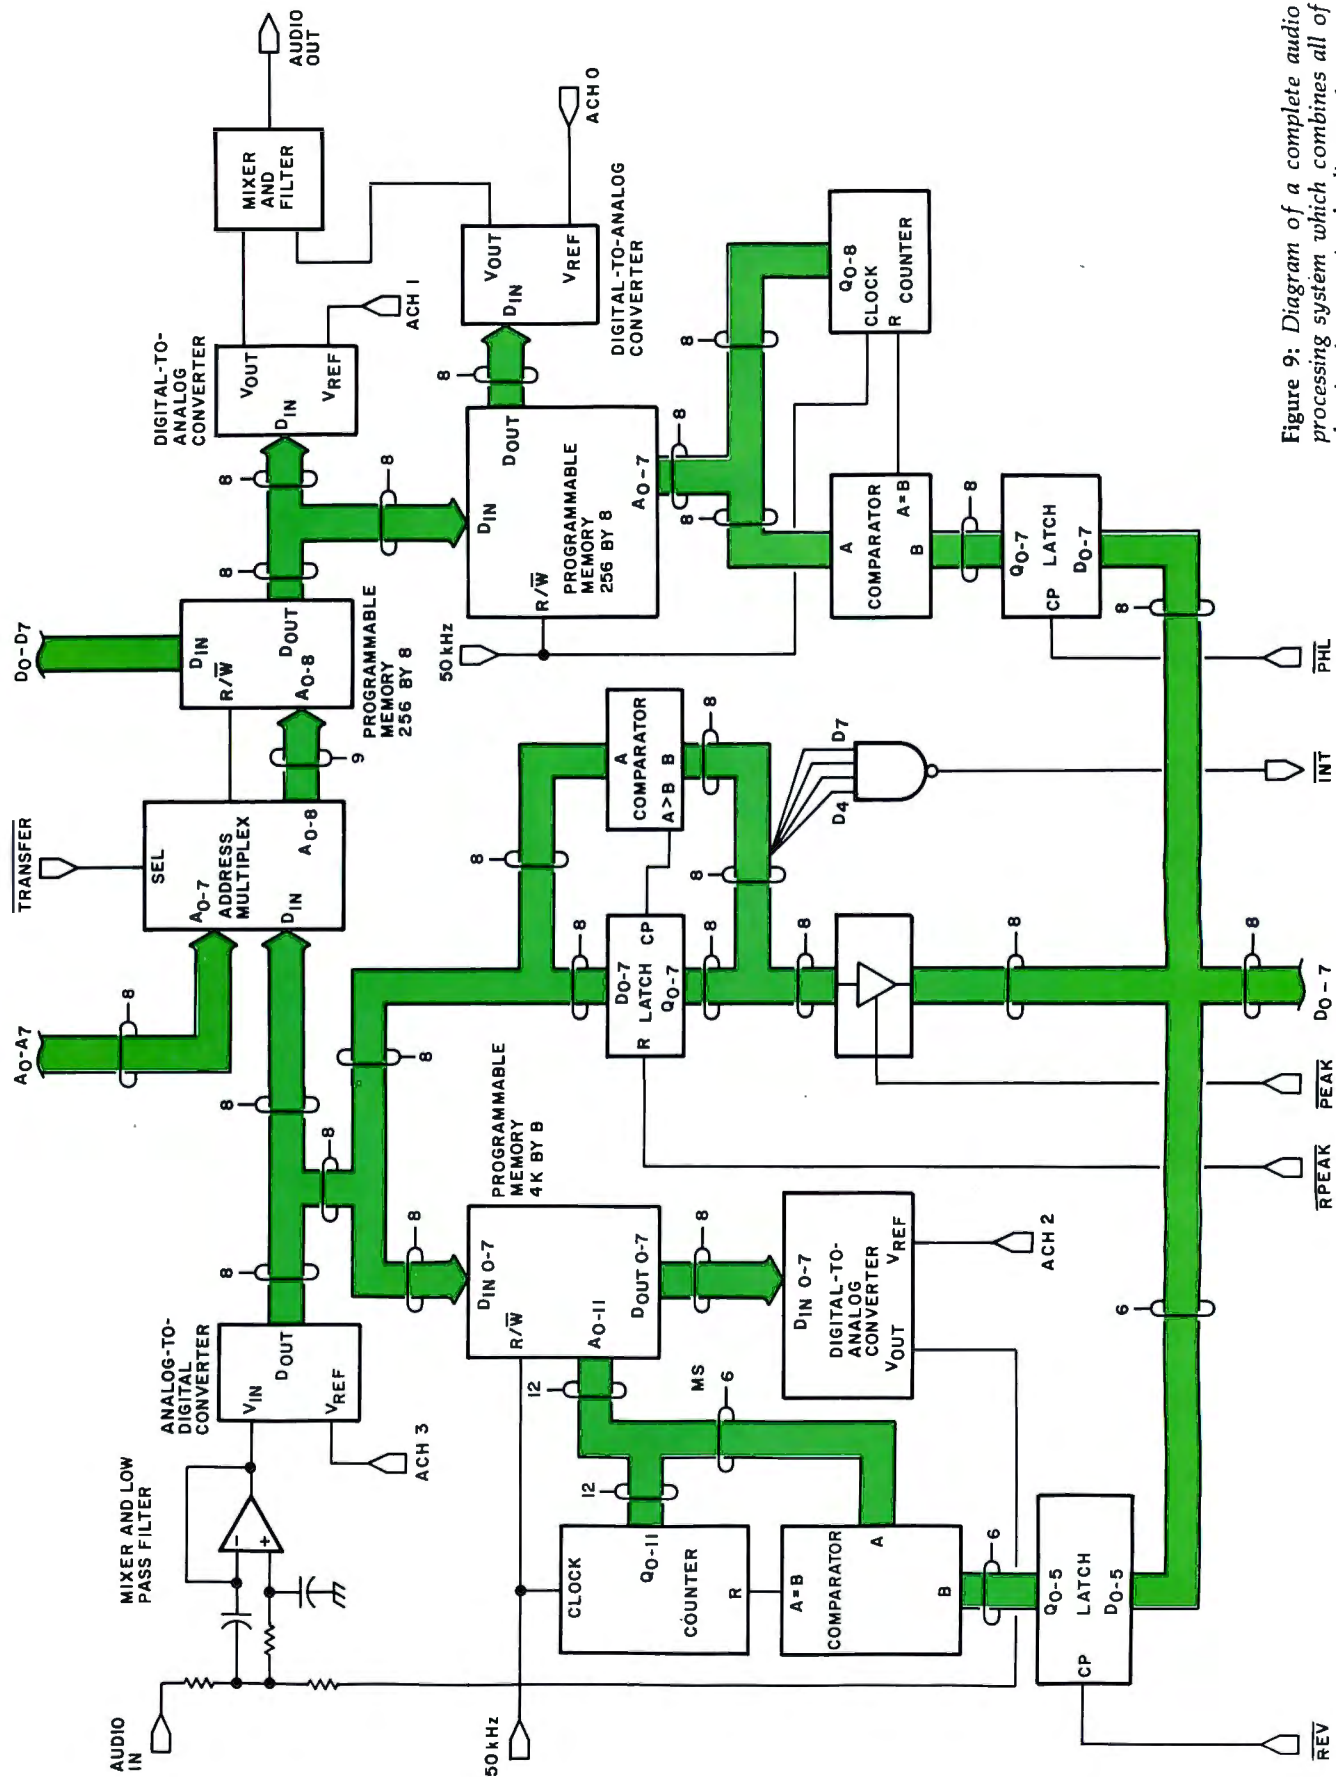

Figure 9: Diagram of a complete audio processing system which combines all of the circuitry previously discussed.

For a more precise sine wave, more states should be used to represent the curve. If the number of states is reduced, higher vibrato frequencies are possible. With eight states, the maximum vibrato frequency (with the routine executing once every ms) is 125 Hz. This is adequate for most applications. For even higher frequencies with less distortion, a voltage controlled oscillator may be added to the circuit.

The gain-control circuitry can also be used to minimize quantization noise by keeping the digital signals at near maximum levels and restoring their dynamics (amplitude variations) at the output digital-to-analog converter. However, care must be taken with this approach to restore the dynamics of delayed signals at levels that reflect the amplitude at the time that they were delayed.

Complete System

Combining the transfer, time-delay and gain-control functions into a single system saves money on hardware since all functions share the same analog-to-digital converter and processor, two of the most expensive components. Figure 9 shows a simplified diagram of the complete system which combines the circuitry described in all previous figures.

The system software is structured so that each function's routine should execute periodically, but each routine may execute with a different period. To control the calling of these function routines, the top level of the system software (shown in the flowchart of figure 10 and with code given in listing 6) is interrupt driven (by the frequency divider of figure 11), executing once every ms. This routine decrements software timers corresponding to each routine. When one of these timers reaches zero, the corresponding routine is called. On system power-up, all timers are initialized, and after executing a particular routine the timer corresponding to that routine is reinitialized.

Listing 6: The code for the interrupt service routine. The real-time clock causes this routine to be entered at intervals of 1 ms. It activates functions according to the proper schedule. Its flowchart is shown in figure 10.

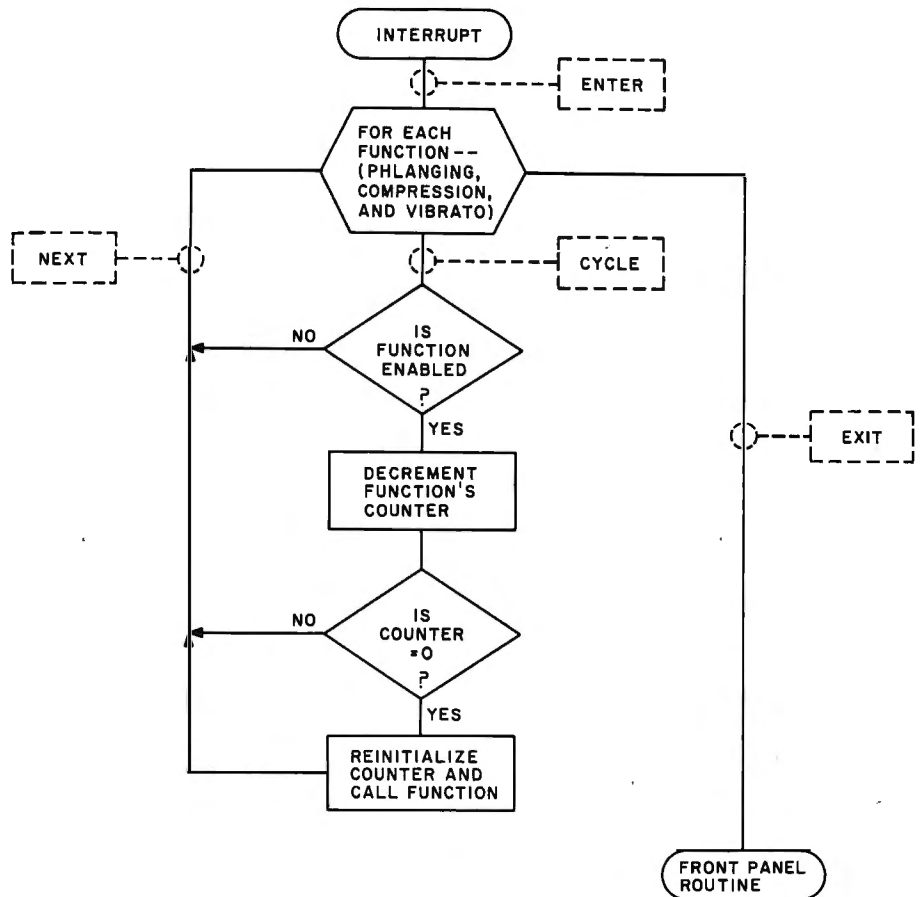

Figure 10: Flowchart of the interrupt service routine. At intervals of 1 ms, an interrupt occurs from the real-time clock, and this interrupt service routine is executed. It calls the appropriate function routines at the proper times by decrementing software counters corresponding to each routine. When one of these counters reaches zero, its software routine is called and the time is reinitialized. If the function is not selected, the counter will not be decremented. The control panel service routine executes during any free time.

\$1995 SPECIAL SYSTEM PRICE

includes H8 Computer with 16K memory, four-port serial I/O and operating software, plus H17 Floppy Disk System (shown here with optional second drive) and H19 CRT Terminal — all in kit form.

Heathkit H8 Computer

- 8080A CPU has more software written for it than any other CPU
- 7 plug-in board positions for flexibility in configuring your system
- Up to 65K memory capacity
- Front panel keyboard for direct access to registers and memory

\$289 kit purchased separately. Was \$379. **You save \$90.**

\$349.00 assembled

Heathkit H17 Floppy Disk System

- Instant access to programs and data
- 102K bytes storage area
- 250 mS typical random access time

- Includes interface controller board
\$495.00 kit purchased separately
\$550.00 assembled

Heathkit H19 Smart Video Terminal

- Z80 microprocessor-controlled
- 25 x 80, upper and lower case
- Direct cursor addressing
- 8 user-programmable keys

\$675.00 kit purchased separately
\$995 assembled

5% discount on software, memory and interfacing

Special 5% discount applies to all software, memory and interface

boards when purchased with the H8 system.

Seven plug-in board positions on the H8 let you configure any combination of memory and I/O's that suits you. Heathkit memory boards come in 16K, 8K and 4K increments. Interface boards are available for parallel, serial and cassette I/O's.

Wide selection of software

Software for the H8 Computer includes operating systems software, MICROSOFT™ BASIC, FORTRAN, wordprocessing, plus innovative applications software for business and pleasure.

HUG has over 400 programs

An extensive library of programs is available to owners of Heathkit Com-

in high-performance \$90 better.

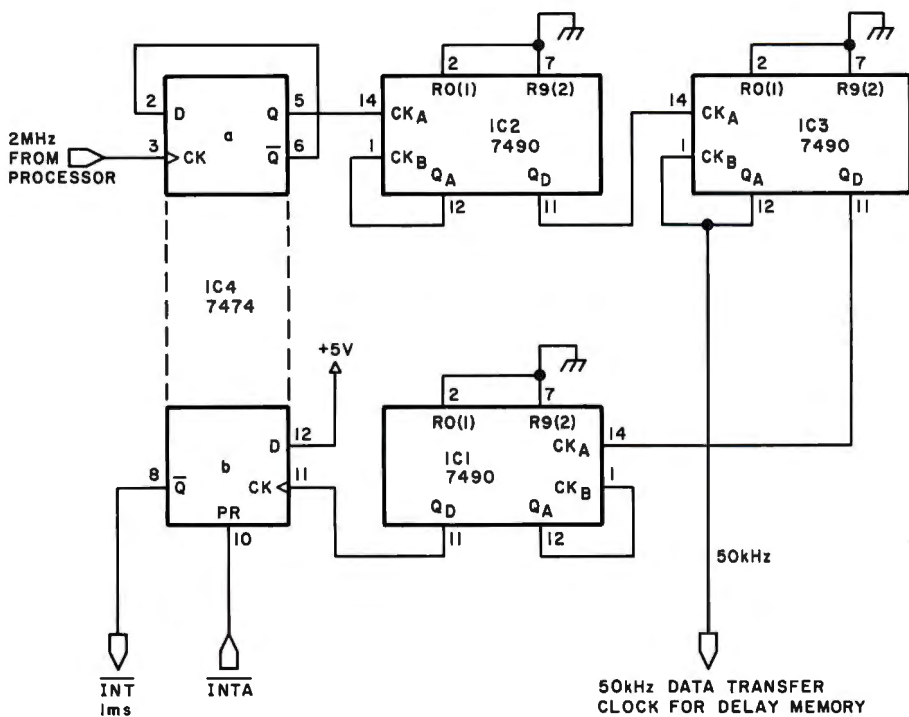

Figure 11: Frequency divider for the 50 kHz data-transfer clock and the 1 ms real-time clock interrupt. The first stage divides the 2 MHz processor clock signal by forty, to obtain 50 kHz. This is further divided by fifty and sent to a flip-flop to interrupt the processor every 1 ms.

Routines that execute once per ms are called on every interrupt and do not have timers. Any time left over at the end of the millisecond is used to service the control panel.

External User Control

The control panel used with the system (the device with which the user communicates with the system, selects functions, and specifies function parameters) can take many forms. A control panel can be as simple as a few toggle switches or as elaborate as a graphics terminal. The schematic diagram for a very simple control panel interface is shown in figure 12. Two pairs of seven-segment light emitting diode (LED) displays show the user which parameter is being observed and the value of that parameter. The value of the parameter can be adjusted by pressing increment or decrement switches. A parameter select switch changes the parameter displayed. The software to operate this panel is shown as a flowchart in figure 13, and the 8080 code is given in listing 7.

THE VITAL
INGREDIENT:
EXPERTISE

Before you buy your new microcomputer, chances are you have a lot of questions. Important questions that could mean the difference between a working system and a wasted system. The vital ingredient is expertise. The microcomputer people at Computer Mart are expert at answering your questions and helping you put together the best system for your application. Whether it's for business, the home, or the laboratory, come see the experts at Computer Mart of New Jersey. We have the vital ingredient.

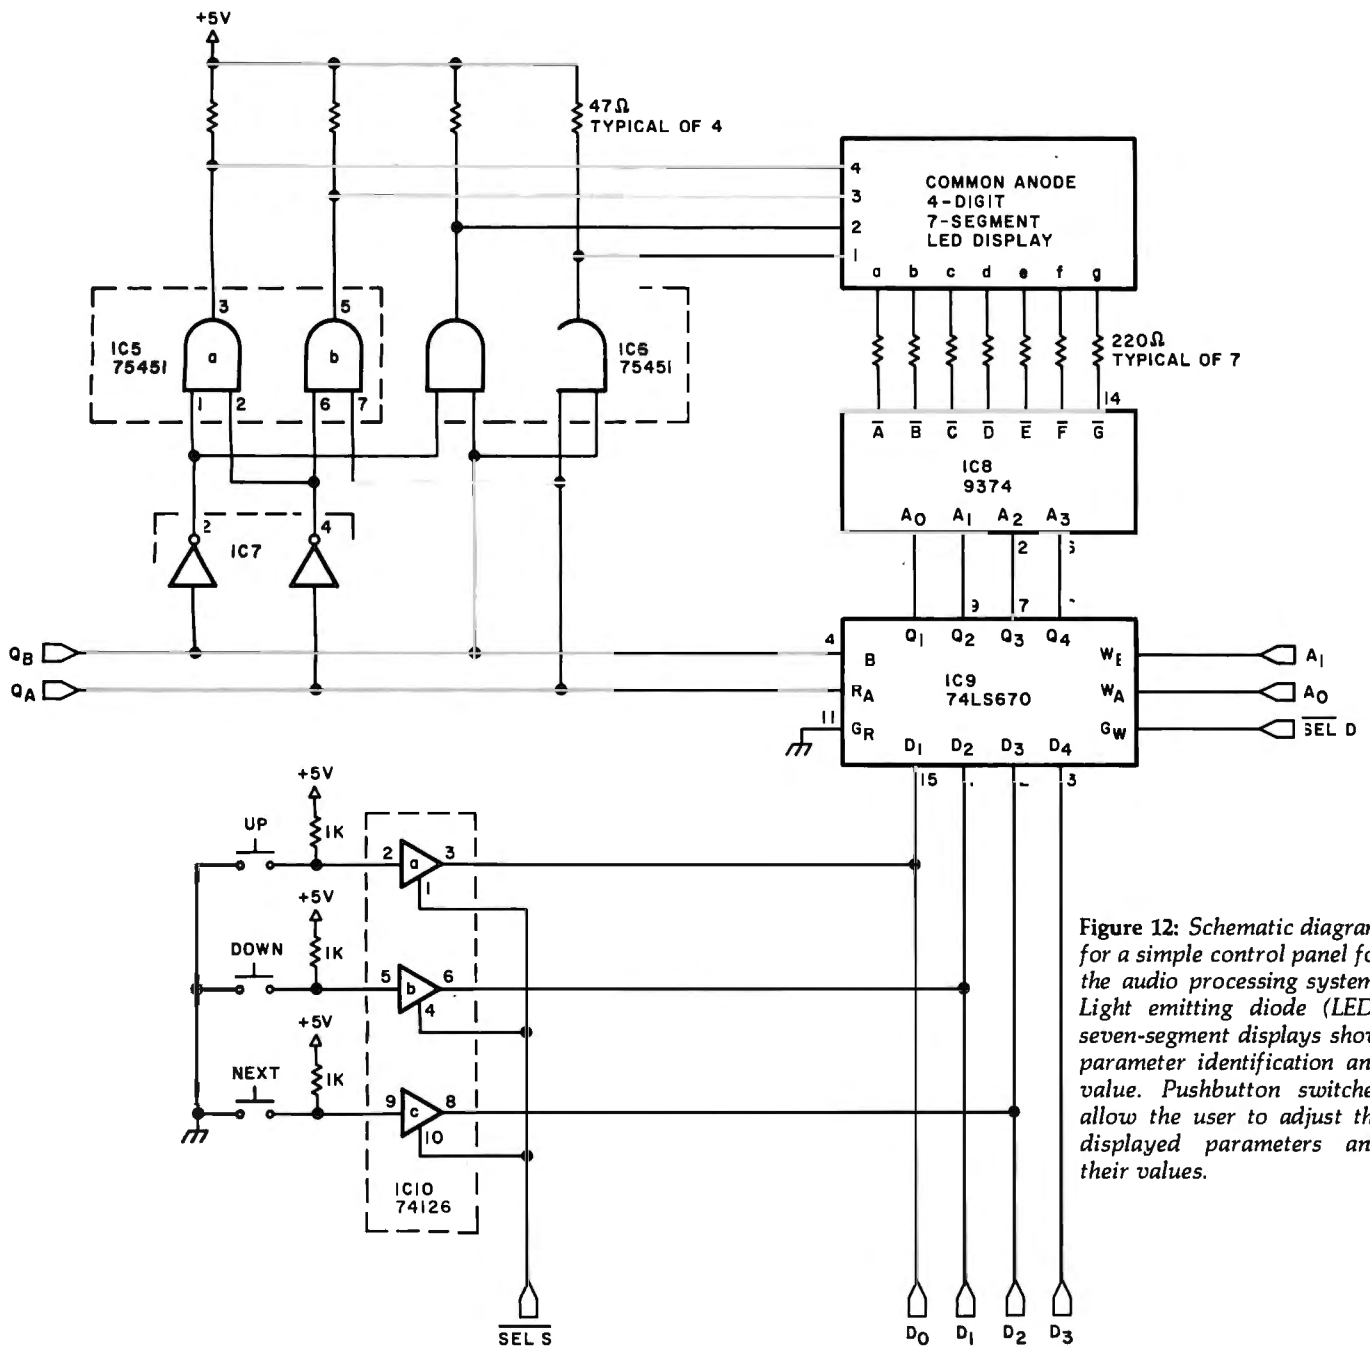

Figure 12: Schematic diagram for a simple control panel for the audio processing system. Light emitting diode (LED) seven-segment displays show parameter identification and value. Pushbutton switches allow the user to adjust the displayed parameters and their values.

This routine looks for transitions of the switches, and updates the display and parameters accordingly.

Conclusion

The interested user is by no means limited to the functions that I have described here. Tonal control, phase-shifting, and even synthesized chords are possible using digital techniques. Using a microcomputer, the possibilities are endless. The microcomputer can even generate the music it processes. There are certainly many unexplored instances where microcomputers can be applied to audio processing.

I have attempted to describe not only the design of one microcomputer audio processing system, but also the methodology used in designing any real-time microcomputer system. Before rushing into the design of a system, a top-down approach to the problem should be used, the system should be defined, a worst case timing analysis of the system should be performed and, if necessary, hardware versus software tradeoffs should be made to distribute tasks and allow reasonable execution times. An intelligent compromise between hardware and software is almost always the best solution.

GLOBAL™ DATABASE MANAGEMENT SYSTEM

for PROGRAMMERS, ACCOUNTANTS, BOOK-KEEPERS, DOCTORS, LAWYERS, PUBLISHERS, SCIENTISTS, MANUFACTURERS, WHOLESALERS, RETAILERS, MANAGERS, LANDLORDS, REAL ESTATE AGENTS, TEACHERS, STUDENTS, ETC.

Extremely comprehensive, versatile user-oriented management system for database creation and list maintenance. Runs under CP/M* and CBASIC2** on a microcomputer system in only 40K RAM.

Completely user-defined file structure with sequential, random and linked file maintenance; user-defined number of fields; data transfer between records; automatic high speed search algorithms with global search function; built-in ISAM; fast sort/merge utility; record selectable output can be formatted (with/without headings, column titles, totals, etc.) and printed on various forms (labels, envelopes, preprinted forms, etc.); links to CP/M commands or programs with automatic return to Global; provides status reports on diskette, data file and hardware environment; disk used as extended memory.

Supplied on standard 8" IBM disk (inquire about other formats), complete with BASIC subroutine library in source code, with comprehensive manual.

Figure 13: Flowchart of the control-panel service routine. It supports the hardware shown in schematic form in figure 12. The three pushbutton switches are polled once per ms to check for transitions. If a transition in state has occurred on the UP switch, the value of the parameter being displayed is incremented. DOWN decrements the value of the parameter, and NEXT displays the next parameter. The routine is set up to handle sixteen single-byte parameters in sequential memory locations. The 8080 code is given in listing 7.

Listing 7: Code of the control-panel service routine which works with the panel circuit presented in figure 12. The flowchart of this routine is shown in figure 13. By polling the pushbutton switches, it allows the user to select function parameters and change their values. This routine is set up to handle sixteen single-byte parameters in sequential memory locations.

The Source for 6800/6809 Software

Technical Systems Consultants, Inc. is The Source for your 6800/6809 systems software needs. From FLEX™, the standard disk operating system of the 680X family, to Sort/Merge, your systems requirements can be filled with the highest quality software in the industry. Nowhere else can you find such variety from a single source. Here are some of the most popular:

Program Name	6800	6809
FLEX for SWTPc	\$90	\$90
FLEX for SSB	90	90
Extended BASIC	100	100
Extended BASIC Precompiler	50	50
BASIC	65	65
BASIC Precompiler	40	40
FLEX Sort/Merge	75	75
Text Editing System	40	35
Assembler	40	40
Text Processing System	60	N/A
Debug Package	55	75
FLEX Utilities	100	60

These packages are available on either 8" or 5" soft-sectored FLEX diskettes (5" 6800 is FLEX 2.0). Price includes user's manual and object code diskette. Certain programs are available on cassette. Contact Technical Systems Consultants for pricing. All orders should include 3 percent for postage and handling (8 percent on foreign orders). Master Charge and Visa are welcome.

Letters

Problems 1 thru ten

Most publications other than BYTE print "two," not "2" in the midst of an English sentence. Now when I read BYTE I have to go through a kind of mental stuttering: "2, oh yes, that means two." It is the same sort of gear shifting I go through whenever I read text that says "hopefully" when "I hope" is meant, or spells "through" as t, h, r, u, as the *Chicago Tribune* used to do. These are all examples of manner interfering with matter.

I do not object to *all* reforms in communication (going metric suits me fine), but this one is unrewarding.

Philip Bacon
3101 NW 2nd Ave
Gainesville FL 32607

The road to truth and beauty is sometimes a convoluted one. You will notice that our humorous experiment with simplistic rules only lasted for an issue or two — and that reason and judgement

have now prevailed. We resolve 1 [sic] thing at a time. . . . CTH

S-100 Core?

I have an S-100 bus computer and would like to install core memory in it. I have been unsuccessful in locating anyone marketing such a device. I would greatly appreciate any information on the subject.

If no one is manufacturing S-100 core, where might I locate core planes that I can interface to the S-100 bus?

Removing Solder — A Comment

William Trimmer's article "Soldering Techniques" (September 1979 BYTE, page 84) covers the basics of soldering very well, but I would like to take ex-

ception to his suggestion to remove solder by "Rap(ping) the edge of the board smartly on the workbench." This practice could crack the board at worst, or the flying solder could bridge across the foil patterns, causing a short.

My technique for desoldering is to take "Solder-Wick," dip it in liquid rosin flux and wick up the solder as Mr. Trimmer mentions in his article. I find that the liquid flux improves the wicking action of the braid.

Weather Radio Information

There seems to be a request for information relating to Weather Satellite Receiving Equipment.

I have had a receiving set in operation since the fall of 1973, using a modified Heathkit GR-110 as a receiver, and using other ideas from the NASA SP 5079.

A much more informative and practical book is *Weather Satellite Handbook*, by Dr Ralph E Taggart of Michigan State University.

Subroutine Parameters Questioned

With all due respect to Professor Maurer, his D(L,L) example in "Subroutine Parameters" (July 1979 BYTE, page 228) would *always* yield strange results, without regard to the particular parameter passing technique employed. If the function of D is to zero the first parameter while doing nothing with the second, calling it with the same actual parameter in both places is a logical inconsistency, demanding that the same thing be made zero and be left alone simultaneously. The CDC 6400 program did not "work" any better than the IBM one; it simply produced a *different* "strange" result, which the programmer apparently found more acceptable.

I also question, on page 230, the statement that the $S = S + X$ example will not work with call-by-reference. Again, the problem here appears to be inherent in the logic of the case. The logic of the subroutine is expected to do $S = S + A(I)$ on the range $I = 1,10$, while at the

same time treat the formal parameter X as standing for a simple variable. I am not familiar with ALGOL 60, but most FORTRANs handle the situation by requiring an array declaration for X in the body of the subroutine's code.

Omri Serlin
POB 62138
Sunnyvale CA 94086

WD Maurer Replies:

When we CALL D(A,B), where D is defined by SUBROUTINE D(X,Y), the basic idea is that X is "really" A and that Y is "really" B. Any time we see an X in the subroutine D, we expect it to stand for A, in the context of this particular call. If, for example, we set X to U and then Y to V, that corresponds to setting A to U and B to V. If A and B are really both the same variable L, then we have set L to U and then L to V, which is perfectly acceptable. If we have set X to U and not set Y to anything, then, if the actual parameters are both L, we should set L to U. The fact that we have not set Y to anything does not mean that the old value of L should necessarily be preserved without modification, since there are many other possible ways that the variable L can have another name; for example, it can be in COMMON, referenced by both D and the program which calls D.

The second of Mr Serlin's concerns is a simple matter of confusion about ALGOL 60. If I put $S = S + X$ in a loop in ALGOL 60, it is capable of doing $S = S + A[1]$ the first time, $S = S + A[2]$ the second time, etc, through the loop. If I put $S = S + X$ in a loop in FORTRAN, it must add the same quantity X each time through the loop. In this case it will be $A(i)$, where i was the value that the variable I takes on when the subroutine is entered. Requiring an array declaration for X would make X into an array name, in which case $S = S + X$ would not be syntactically valid.

W D Maurer

SEAS
Washington DC 20052

Quest Comments

Thanks so much for the QUEST program listed in the July 1979 BYTE. As novices, it was fun modifying this routine to run on our TRS-80.

By placing personal references in some of the maze locations, our family has received hours of fun, often late into the night.

For any beginners who wish to do more than buy cassette games, listings such as this are well worth a BYTE subscription.

Harold and Marguerite Jenkins
10 Peaceful Ln
Norwalk CT 06851 ■

Konan's SMC-100 is versatile, fast, cost efficient. It's the disk controller that brings S-100 bus micro computers together with large capacity hard disk drives.

Versatile

Interfaces S-100 bus micro computers with all fixed or removable media disk drives with storage module (SMD) interfaces. Each Konan SMC-100 will control up to 4 drives ranging from 8 to 600 megabytes per drive, including most "Winchester" type drives. Up to 2400 megabytes of hard disk per controller! And you can take your pick of hard disk drives: Kennedy, Control Data, Fujitsu, Calcomp, Microdata, Memorex, and Ampex, for example.

Fast

SMC-100 transfers data at fast, 6 to 10 megahertz rates, with full onboard sector buffering and sector interleaving, and a DMA that's faster than other popular S-100 DMA controllers.

Cost efficient

SMC-100 is priced right to keep your micro computer system micro-priced. It takes advantage of low-cost-per-megabyte disk drive technology to make the typical cost less than \$80 per megabyte. The OEM/Dealer single quantity price is only \$1650, with driver ROM option. Excellent quantity discounts are available.

SMC-100 availability:

Off the shelf to 30 days in small quantities. (Complete subsystems are on hand for immediated delivery.)

Konan has the answers. Talk to them today. Call direct on Konan's order number: 602-269-2649. Or write to Konan Corporation, 1448 N. 27th Avenue, Phoenix, Arizona 85009.

Microcomputing comes of age.

Ohio Scientific's OS-65U Level 3 operating system software brings new networking and distributed processing capabilities to microprocessor based computer systems.

Until now, the only alternative for low cost multiple-user computer applications was time-shared systems. However, a serious drawback of microcomputer or mini-computer multi-user time-share systems is the fact that under heavy work loads they slow down to a crawl since the central processor time in such a system is shared by all of the users.

In a microprocessor based distributed processing system, using floppy based microcomputers as intelligent terminals (local systems) most of the work load is handled locally. Overall system performance does not degrade under heavy job loads. Each local system performs entry, editing and execution while utilizing the central data base for disk storage, printer output, and other shared resources.

For more demanding applications it is desirable to have several data bases, each with its own collection of local systems. Such an inter-connected set of data bases is called a network. Each data base and its local intelligent and dumb terminals is called a cluster.

Level III

OS-65U Level 3 now supports this advanced networking and distributed processing capability as well as conventional single user operation and time-sharing. Level 3 now supports local clusters of intelligent microcomputer systems as well as

dumb terminals for the purpose of utilizing a central Winchester disk data base and other shared resources. The system also has full communications capability with other Level 3 data bases providing full network capability.

The system utilizes Ohio Scientific's low cost, ultra high performance computer systems throughout for intelligent terminals as well as data bases. This general systems configuration provides a cost/performance ratio never before attained in this class of computer power.

Level 3 resides in each network data base. A subset system resides in each intelligent terminal. Each data base supports up to 16 intelligent systems and up to 16 dumb terminals. However, since dumb terminals can heavily load the system, they should be kept to a minimum. Level 3 also supports a real time clock, printer management, and other shared peripherals.

Data Base Requirements

Minimal requirements for a Level 3 network data base are a C3-C or C3-B computer system with 23 or 74 megabytes respectively, console terminal, 100K bytes RAM and a CA-10X 16 port I/O board for network and cluster communications.

Intelligent Terminal Requirements

Any Ohio Scientific 8" floppy based computer with 56K RAM and one data base communications port.

Connections

Intelligent terminals and networked data bases are connected by low-cost cabling. Each link can be up to 10,000 feet long at a transfer rate of 500K bits per second, and will cost typically 30¢ a foot (plus installation).

Syntax

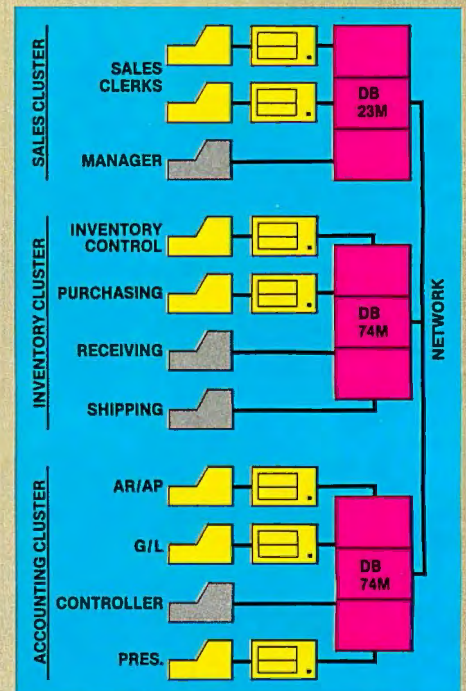

Existing OS-65U based software can be directly installed on the network with only one statement change! Level 3 has the most elegantly simple programming syntax ever offered on a computer network.

File syntax is as follows:

DEV A,B,C,D.	Local Floppies	} unchanged from single user and timeshare systems
DEV E	Local hard disks	
DEV K-Z	Specific network Data Bases	

Each of up to 8 open files per user can be from 8 separate origins. Specific file and shared peripheral contentions are handled by 256 network semaphores with the syntax Wait N
Wait N, close.

The network automatically prioritizes multiple resource requests and each user can specify a time out on resource requests. Semaphores are automatically reset on errors and program completion providing the system with a high degree of automatic recovery.

A Typical System

A typical system with two network data bases will have 148 megabytes of disk, four intelligent subsystems equipped with dual floppies, two dumb terminals, a word processing printer, a fast line printer, network data base manager software and 1000 ft. of inter-connecting cable. Utilizing .7 MIPS processors throughout it will cost less than \$50,000 plus installation. GT option computers (1.2 MIPS) can be utilized at a slightly higher cost.

One Step at a Time

Best of all, Ohio Scientific users can develop distributed processing systems economically one step at a time. A user can start with a single user floppy system, add a hard disk, then time-sharing, then a second Winchester data base for backup and finally cluster intelligent terminals to achieve a full network configuration.

The Microcomputers you should take seriously.

The Challenger III Series is the micro-computer family with the hardware features, high level software and application programs that serious users in business and industry demand from a computer system, no matter what its size.

Since its introduction in August, 1977, the Challenger III has become one of the most successful microcomputer systems in small business, educational and industrial development applications. Tens of thousands of Challenger III's have been delivered and today hundreds of demonstrator units are set up at systems dealers around the country.

The Challenger III systems offer features which make their performance comparable with today's most powerful mini-based systems. Some of these features are:

Three processors today, more tomorrow.

The Challenger III Series is the only computer system with the three most popular processors—the 6502A, 68B00 and Z-80. This allows you to take maximum advantage of the Ohio Scientific software library and programs offered by independent suppliers and publishers. And all Challenger III's have provisions for the next generation of 16 bit micros via their 16 bit data BUS, 20 address bits, and unused processor select codes. This means you'll be able to plug a CPU expander card with two or more 16 bit micros right in to your existing Challenger III computer.

Systems Software for three processors.

Five DOS options including development, end user, and virtual data file single user systems, real time, time share, and networkable multi-user systems.

The three most popular computer languages including three types of BASIC plus FORTRAN and COBOL with more

languages available from independent suppliers. And, of course, complete assembler, editor, debugger and run time packages for each of the system's microprocessors.

Applications Software for Small Business Users.

Ready made factory supported small business software including Accounts Receivable, Payables, Cash Receipts, Disbursements, General Ledger, Balance Sheet, P & L Statements, Payroll, Personnel Files, Inventory and Order Entry as stand alone packages or integrated systems. A complete word processor system with full editing and output formatting including justification, proportional spacing and hyphenation.

OS-DMS, the software star.

Ohio Scientific offers an Information Management system which provides end user intelligence far beyond what you would expect from even the most powerful mini-systems. Basically, it

allows end users to store any collection of information under a Data Base Manager and then instantly obtain information, lists, reports, statistical analysis and even answers to conventional "English" questions pertinent to information in the Data Base. OS-DMS allows many applications to be computerized without any programming!

The "GT" option yields sub-microsecond microcomputing.

Ohio Scientific offers the 6502C microprocessor with 150 nanosecond main memory as the GT option on all Challenger III Series products. The system performs an average of 1.5 million instructions per second executing typical end user applications software (and that's a mix of 8, 16 and 24 bit instructions!).

Mini-system Expansion Ability.

Challenger III systems offer the greatest expansion capability in the microcomputer industry, including a full line of over 40 expansion accessories.

Networking and Distributed Processing

OS-65U level 3 now provides networking capabilities as well as time sharing ability allowing Challenger III based systems to be expanded to meet the most demanding business applications.

Prices you have to take seriously.

The Challenger III systems have phenomenal performance-to-cost ratios. The C3-S1 with 48K static RAM, dual 8" floppies, RS-232 port, BASIC and DOS has a suggested retail price of under \$4000. 80 megabyte disk based systems start at under \$12,000. Our OS-CP/M software package with BASIC, FORTRAN and COBOL is only \$600, and other options are comparably priced.

For literature and the name of your local dealer, CALL 1-800-321-6850 TOLL FREE.

Circle 300 on inquiry card.

C3-B wins Award of Merit at WESCON '78 as the outstanding microcomputer application for Small Business.

A Proposed Graphics Software Standard Part 2

Dr Vincent C Jones, 1913 Sheely Dr, Ft Collins CO 80526

Sample Implementation

In part 1, the framework for a proposed graphics software standard was discussed.

An implementation of the 8080 assembly language protocol for use with the Cromemco Dazzler (listing 1) illustrates how the algorithms and standards presented translate into working software. Except for a few instances where the architecture of the 8080 or Dazzler allowed substantial simplification, the program code corresponds exactly to the Nassi-Schneiderman charts in part 1. The major deviations are in the handling of control characters in the routine CHAR, affected byte address calculation in DOT, and the termination condition in PAGE.

The software starts by defining the standard entry points. The Dazzler is assumed to be jumpered to use ports 16 and 17 (octal), the Cromemco default. If you own a Dazzler and it uses different ports, the I/O (input/output) commands in INITG, CHAR, and ANIMAT will need modification.

8080/Dazzler INITG

The first step in all these routines is to preserve any registers affected. In this case, HL is not saved because its contents will be replaced by the display description parameters.

The Dazzler requires the refresh buffer to start at an even multiple of 512. No test is made to check and see if the address provided is valid; instead, an algorithm that converts any address to a valid address and a valid address to itself is used. The refresh buffer address calculated is then stored in the two bytes labeled RBUF. Placing all the variables in a single section of memory is not only good programming practice, it also permits efficient setting of defaults by using register indirect addressing. The call to the CHAR routine with zero accumulator sets the display mode to MAXR and takes care of outputting the required controls to the Dazzler's Color/Mode port.

After calling PAGE to clear the screen, the Dazzler is finally turned on. The high-byte of the refresh buffer address is retrieved from memory and rotated into the bit position expected by the Dazzler. The OUT instruction starts the display, if it is not already on. The final step, before restoring register values, is to load the appropriate parameter description into HL. Hexadecimal 8AFC indi-

IS READY . . .

WITH
WITH
WITH

32K or 16K RAM

- 16K or 32K Static Memory. ● S-100 Bus Connector. ● 9 Regulators provide excellent heat distribution. ● Extended addressing (bank switching).
- Low power requirement. ● Phantom line.
- 20-Page operating manual. ● Full 1-year warranty. ● 32K version assembled and tested \$485.00. ● 16K version available assembled and tested, \$290.00.

Double Density Disk Controller 8" or 5"

This One

Works!!

- Designed for CPM®. ● On Board Boot.
- 2MHz-4MHz Operation. ● Switch Selectable Write Precomp. ● "Personality Board" to modify drive configurations (no jumper wires). ● 2 Data separators; one digital, one analog. ● Drive Diagnostic Software included. ● Complete documentation. ● Runs without occupying any system RAM. ● Transparent Density Select. ● \$385.00.

SOLUTIONS
SOLUTIONS
SOLUTIONS

DP Z-80 CPU

- 2MHz or 4MHz operation (jumper selectable).
 - Power on jump to On Board Eprom (2708 or 2716).
 - M1 Wait State for 160% thruput enhancement with 450ns memory. ● 3 Parallel I/O ports.
 - Two Serial RS-232 I/O ports. ● Baud rates: 50 to 19.2K. ● \$260.00.
- (Cable and Eprom extra)

ALL
YOU
EVER
NEED!!

DP S-100 Mainframe

- 12 slot S-100 Motherboard with power supply +8@20a, ±16@6a (nylon card guides).
- Mates with disk systems shown in center column.
- Neat, compact, extremely reliable mainframe.
- Also available with S-44 2 user, 3 CPU system with features similar to Multi-user TRS-80 Expansion Package. Kit \$295.00

Disk Drive Storage

- Cabinet comes with multiple power.
- Supply to suit all popular disk drives ±5@5a, +24@6a.
- DP-1000K Twin double density Shugart SA-800B or Siemens FDD-100-8. (2 megabytes). \$1350.00
- DP-2000K Double sided, double density Shugart SA-850-R or Siemens FDD-200-8 (2 megabytes). \$1850.00
- Drive box less drives with ample power supply. Kit \$295.00

Ultimate TRS-80 Expansion Package - 340K of Double Density

- Cost effective Z-80 15 slot dual drive S-44 5" computer. Mates with TRS-80 or with terminal.
- Excellent expandable starter system for small business.
- Also an unbeatable choice for dedicated word processor applications or industrial scientific use (80 x 24 video).
- The S-44 card set ensemble is specifically designed for business engineering and technical applications.
- 50-60 Hz (110/220VAC).
- Provides expansion to 64K CPM operating system, modems, multiuser, etc. \$1775.00 (32K)

Relative Subroutines for the Z80

Dennis Bathory Kitz, Roxbury VT 05669

One of the problems associated with writing versatile, relocatable programs for microprocessors is making decisions on how to use subroutines. The main difficulty occurs when a program using subroutines is to relocate itself; every call address must be rewritten. On the other hand, avoiding subroutines wastes valuable memory space.

I faced this dilemma when developing a program to exercise the memory in my TRS-80; a bit had failed, and I needed a program that could reside in low-memory during a test of high-memory, and relocate itself to high-memory in order to test low-memory. The lengthy process had to be repeated many times (preferably while I was asleep), and leave the results displayed on the monitor the next morning. The necessary ingredients for this program were: a test of all combinations of bits in a byte; a section to identify the bad address; hexadecimal and ASCII conversion routines; a clear-screen and address display routine; and a section to relocate the program and display that fact. A further requirement was that the program reside in a single page of memory.

The identification for each bad address was written as a subroutine; nested inside were the conversions to hexadecimal and ASCII and the display section. Altogether, six separate subroutine calls were needed to identify and display each faulty address.

Self-relocation of the program could have ended with a flurry of activity, transferring the program and rewriting every CALL with a specific new address.

Instead, it was possible to write the program with "relative" subroutines which are not address-specific. This concept is not entirely new, and some late-generation processors employ many such position-independent commands. However, the current crop of popular chips does not offer any direct way of accessing a nearby subroutine. The following procedure illustrates one way it can be achieved with the Z80:

- determine the offset from the end of the subroutine back to the main program flow;
- assign this value as the operand of a relative jump placed at the end of the subroutine;

- jump to the subroutine.

Here is an example of a "relative call and return" situation — and it uses only two bytes more than a standard subroutine:

```
1000    LD IX,1080    ;CENTER POINT OF ONE PAGE
1004    [MAIN PROGRAM]
      .
      .
1040    LD (IX+8),BD ;IDENTIFY RETURN OFFSET AND
1044    JR 20        ;PUT IN PLACE
1046    [MAIN PROGRAM]
      .
      .
1066    [SUBROUTINE]
      .
      .
1087    JR XX        ;RETURN TO MAIN PROGRAM
                          FLOW
```

Note that, like an absolute subroutine, this configuration may be entered at any point — only the offset value loaded into the return jump must change.

In the case of a conditional return, moreover, the circumstances gain only one step in complexity, as the return value cannot be determined by the main program before the subroutine is executed. Instead, whenever a return condition is met during subroutine execution, the conditional jump transfers control to the last instruction of the subroutine, which is the "loaded" jump. It then returns to the main program flow.

Both these procedures have one characteristic that many programmers tend to avoid, and that is their self-modifying activity. Naturally, this obviates their use in read-only memory. But if it is important to have a relocatable module, it can be achieved with only one register (IX or IY) needing a specific address.

The memory use benefits of either method can be determined quickly. If it takes 5 bytes to rewrite an address directly, and a standard CALL and return combination needs 4 bytes, then a 6-byte unconditional or an 8-byte conditional "relative call" is the obvious choice. Overall, these methods provide an efficient and versatile escape from the usual complexities of creating relocatable programs. ■

APL/S: An Alternative

Robert G Brown, 777 S Mathilda Ave Apt D148,
Sunnyvale CA 94087

About the Author

Robert G Brown is an independent consultant after having worked for IBM for 13 years. He began using APL in 1968 and structured programming in 1970. When he designed the APL/S language in 1978, he attempted to combine structured programming with APL on a small computer in a way which removes some of the common objections to both.

APL/S is a modified subset of APL plus structured-programming control figures. It is intended to be a good first language both for those who may go on to more powerful languages such as Pascal or APL, and for those whose computational needs are destined to remain modest.

Pseudocode

Structured programming is a collection of techniques that help produce demonstrably correct programs. One of the fundamental ideas is to first state the action of the program in what is sometimes called *pseudocode*, or structured English, then progressively refine the statements of the program toward the programming language being used.

With structured English, any imperative statement can be used, but alternation and repetition statements are restricted to a few well defined forms. In this case, the forms are IF-THEN-ELSE, ENDIF for alternation and WHILE-DO, ENDWHILE for repetition. Their intuitive meaning can be illustrated by a set of dieting instructions.

The instructions are to keep eating, one byte at a time, as long as you are hungry. When you are no longer hungry, ask yourself whether you want to get fat. If you do, eat some more. A structured English statement of these instructions is:

```
WHILE you are hungry
DO eat a byte
ENDWHILE
IF you want to get fat
THEN eat some more
ENDIF
```

An APL/S Program

The pseudocode for a guess-the-number-game program is shown in listing 1a. The input is a series of guesses at a

Photo 1: An immediate-mode calculation displayed on an ordinary television set. The user entered "+/2 4 6". This expression was evaluated, and the result (12) was displayed. The +/ characters indicate that the elements of the array 2 4 6 should be added. Therefore 2+4+6 gives 12 as the result. The cursor (an inverse video U, which shows up as a white square with a U inside) indicates that the keyboard is open for the next immediate-mode entry. The histogram bars are left over from a previous calculation.

Photo 2: Program AVE, which computes the average of a set of numeric observations. Input is from the keyboard as a series of numeric values — an array constant. The input, returned by the KEYB function, is assigned to OBS, thus making OBS an array. The average value is computed by adding up the elements of the array (+/OBS) and dividing the sum by the size of the array (SIZE OBS). Since the result is not assigned to a variable, it is displayed.

Listing 1a: Pseudocode for a guess-the-number-game program. This type of expression may be called Structured English. See listing 1b for the APL/S equivalent.

```
Pick a number between 1 and 100
Set the number of guesses to 1
WHILE the guess from the keyboard is not equal
  to the number picked
DO add 1 to the number of guesses
  IF the guess is higher than the number
  THEN display "Too high"
  ELSE display "Too low"
  ENDIF
  Display "Try again"
ENDWHILE
Display "Number guesses-"
Display the number of guesses
```

randomly selected number. The outputs are messages saying "too high," "too low," and "try again." When the number is correctly guessed, the number of guesses made is displayed.

The corresponding APL/S program, named GUESS, is shown in listing 1b. It is a line-for-line translation of the pseudocode. By looking at the pseudocode and the sample execution in listing 2, the programmer should be able to understand the main points of the APL/S program, although all the details may not be clear.

A Description of APL/S

A more complete and precise description of APL/S is provided by the syntax diagrams in figure 1 thru 5 and

Photo 3: The program AVE is executed by keying in its name. Keyboard input is prompted by a question mark (?). The user entered the 3-element array constant 1.5 2 2.5. In the program, $+/\text{OBS} \div \text{SIZE OBS}$ was evaluated as $+/\text{OBS}$ (giving 6) divided by SIZE OBS (giving 3) for a result of 2.

Listing 1b: APL/S program for the guess-the-number game. In this implementation of the language, keywords such as PROGRAM and RANDOM may be abbreviated by the first four letters. See listing 2 for an example of the execution of this routine.

```
PROGRAM GUESS
  NUM=RANDOM 100
  NGES=1
  WHILE NUM NE GES=KEYB
  DO NGES=NGES+1
    IF GES GT NUM
    THEN "TOO HIGH"
    ELSE "TOO LOW"
    ENDIF
    "TRY AGAIN"
  ENDWHILE
  "NUMBER GUESSES-"
  NGES
ENDPROGRAM
```

Listing 2: Example execution of the program of listing 1b. Execution of a program is started by typing the name of the program, in this case GUESS. User input is prompted by a question mark (?) character.

```
GUESS
?50
TOO HIGH
TRY AGAIN
?25
TOO LOW
TRY AGAIN
?32
NUMBER GUESSES-
3
```

the function descriptions in table 1. Starting at the diagram labeled Program, a path through the diagrams defines a syntactically correct APL/S program. The diagrams do not specify APL/S action (that is, the meaning or semantics of the program).

Each circle indicates a *terminal symbol*. Terminal symbols become part of the program text exactly as shown. The boxes indicate *nonterminals*. For each nonterminal there is a diagram (or, for functions, a description in table 1). When all nonterminals have been replaced with sequences of terminals according to the diagrams (or table 1), the result is a syntactically correct APL/S program.

The syntax diagrams in figures 1 thru 5 do not cover statements for loading, saving, editing, or tracing the execution of programs. A complete description of APL/S can be found in the paper "An Introduction to APL/S" (part of the *Conference Proceedings of the Third West Coast Computer Faire*, November 1978) and the *APL/S User's Manual* by W Judd and S Cintz (available from the VideoBrain Computer Co).

Table 1: APL/S functions with equivalent APL functions shown for comparison.

Because of the limited character set available, the relational functions are denoted with alphabetic symbols (eg: NE for ≠) and assignment is denoted by = instead of the preferable ← of APL. In most other cases, functions which are denoted in APL by special characters are denoted in APL/S by the name of the function as given in descriptions of APL.

In APL/S, mathematical formulas are evaluated *left to right* with addition and subtraction done last. For example, $2*4+10\times 3-1$ is evaluated as follows:

$$\begin{aligned}
 &2*4+10\times 3-1 \\
 &16+10\times 3-1 \\
 &16+ 30-1 \\
 &46-1 \\
 &45
 \end{aligned}$$

Figure 1: Syntax diagram showing global structure of an APL/S program.

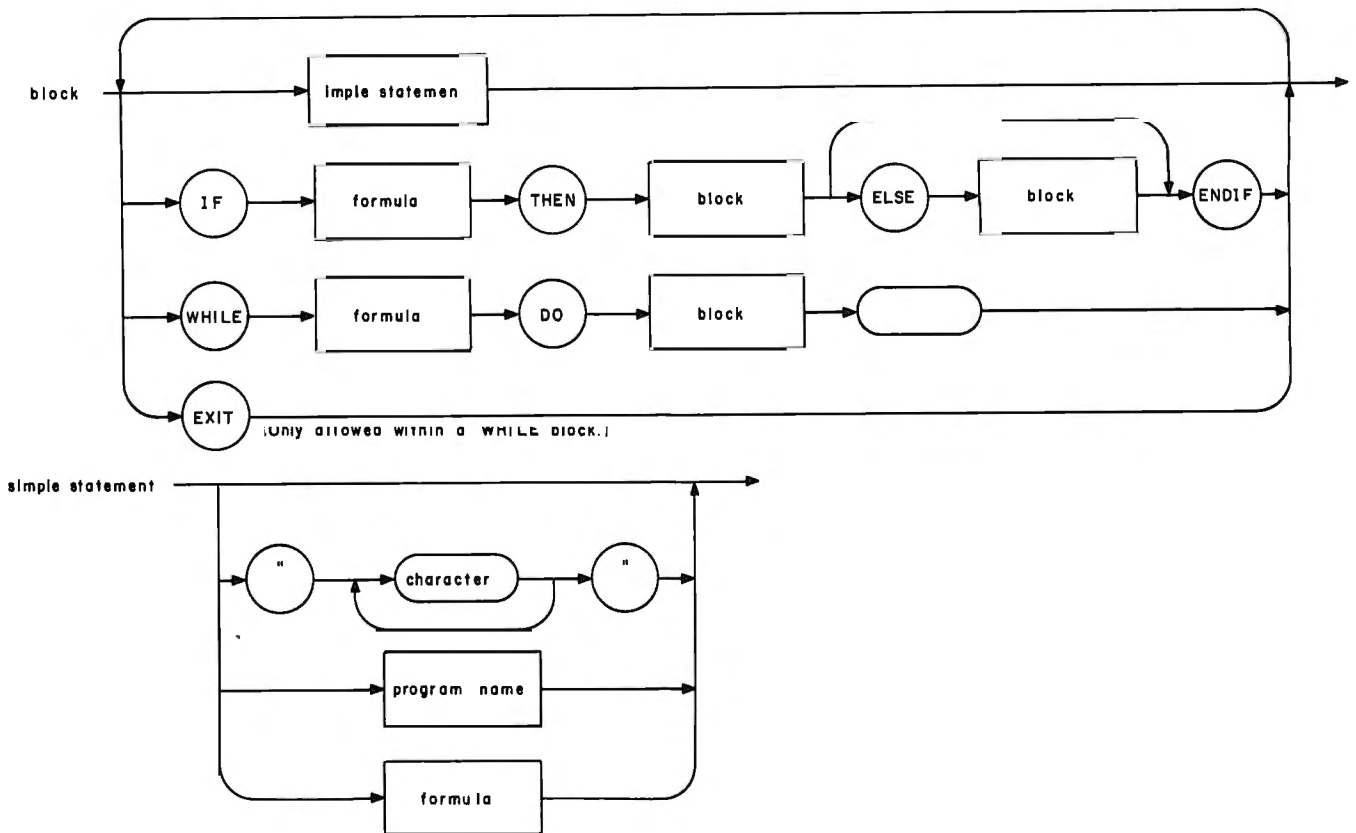

Figure 2: Syntax diagram for block and simple statement structures.

For an assignment statement, evaluation cannot be strictly left to right. For example, the statement $A = 10 + 1$ is evaluated by first adding 10 and 1 for a result of 11, then assigning the 11 to A.

Evaluating the right hand side of an assignment before performing the assignment is carried forward to the case of an assignment embedded within a formula. For example:

```

3 × A = 10 + 1
3 × A = 11
3 × 11
33

```

The use of assignment within a formula is illustrated in the program GUESS of listing 1b in the line `WHILE NUM NE GES=KEYB`. The evaluation of the line goes as follows: the KEYB function reads the keyboard and returns the value entered, the assignment operation places the value into the variable GES, and the NE function is then evaluated to 1 if NUM is not equal to GES or to 0 if NUM is equal to GES. WHILE will then have an argument of 0 or 1.

WHILE, IF, AND, OR, and all the relational functions treat 1 as true and 0 as false. APL/S makes no data type distinctions such as boolean, integer, or real — a number is a number. Functions such as AND are defined on a subset of the numbers, namely 0 and 1.

The control figures of APL/S are Sequence; IF-THEN-ELSE, ENDIF; WHILE-DO, ENDWHILE; and Sub-

programs. There is no GOTO statement, but there is an EXIT for early termination of a WHILE loop. Because all control figures are self terminating (ie: ENDIF, ENDWHILE, ENDPROGRAM), there is no need for BEGIN-END pairs to form compound statements. Anywhere a single statement can appear, so can a block of statements.

Programs can be invoked recursively. The major weakness is that all variables are global. These facilities of the language are powerful enough that the popular eight-Queens problem can be solved by an APL/S program which closely follows the recursive and well structured solution given by Dijkstra. (The differences are array bounds and local variables.)

The eight-Queens problem was discussed from a beginner's viewpoint in an article in the October 1978 BYTE ("Solving the Eight-Queens Problem," by Terry Smith, page 122) and from a more sophisticated vantage by several readers in the February 1979 BYTE ("Eight-Queens Forum," pages 132 through 148). Dr E W Dijkstra's solution is found on pages 72 thru 82 of *Structured Programming*, by Dahl, Dijkstra, and Hoare (Academic Press, 1972):

Like APL, in APL/S all scalar functions are extended element-by-element to arrays, any scalar two-argument function can be used to reduce an array, and mixed functions such as SIZE (ρ in APL) are defined. Unlike APL, in APL/S arrays are restricted to one dimension, and subscript expressions must evaluate to scalars (or one-element arrays). Some examples should help clarify the array features.

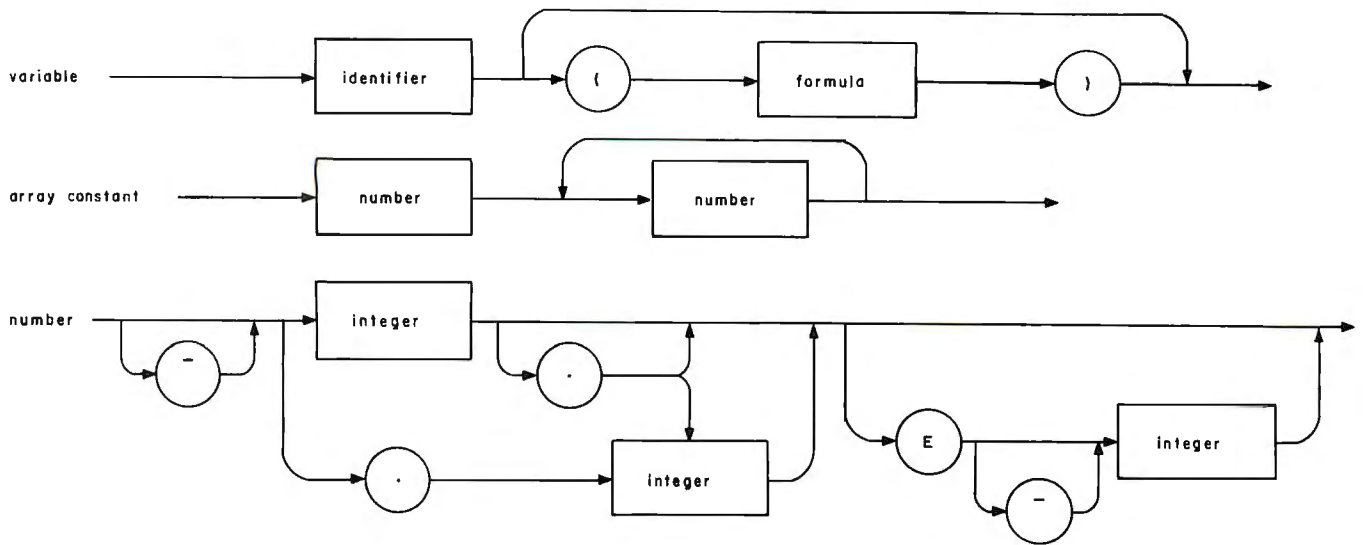

Figure 3: Syntax diagram for variable, array constant, and number structures.

Some Examples

Any simple statement (as defined in figure 2) can be entered for immediate evaluation. Photo 1 shows an example of an immediate mode calculation on the VideoBrain computer. The user entered `+ / 2 4 6`. It was evaluated and the result, 12, was displayed. The "2 4 6" is

an example of an array constant. Addition was used to reduce the array to a scalar. Reduction by addition (+ /) can be visualized as: `+ / 2 4 6` gives `2+4+6` gives 12.

A more realistic use of arrays in immediate mode is the calculation of net present value. Given the one-dimensional array of cash flows, $C=(C_1, C_2, \dots, C_n)$, the net present value (NPV) at an interest rate I , is given by:

$$NPV = \sum_{j=1}^{j=n} \frac{C_j}{(1+I)^j}$$

In APL/S, the formula for the net present value is:

$$+ / (C \div ((1+I) * \text{INDEX SIZE } C))$$

For comparison, the equivalent formula in APL is:

$$+ / C \div (1+I) * \iota C$$

The two formulas are similar, differing only in function names and parentheses (to insure the same order of evaluation).

Because this kind of use of the array facilities is at the very heart of APL or APL/S programming, it is essential to understand how such formulas are evaluated. Let $I=0.1$ and $C = \text{'100 50 150'}$. The evaluation of the APL/S formula can be traced through its intermediate results:

$$\begin{aligned} &+ / (C \div ((1+I) * \text{INDEX SIZE } C)) \\ &+ / ('100 50 150 \div (1.1 * \text{INDEX SIZE '100 50 150}')) \\ &+ / ('100 50 150 \div (1.1 * \text{INDEX SIZE } 3)) \\ &+ / ('100 50 150 \div (1.1 * 1 \ 2 \ 3)) \\ &+ / ('100 50 150 \div (1.1 \ 1.21 \ 1.331)) \\ &+ / ('90.909 \ 41.32 \ 112.7) \\ &= 90.909 + 41.32 + 112.7 \\ &= 63.111 \end{aligned}$$

SPECIAL INTRODUCTORY OFFER

ANADEx

DP-8000 LINE PRINTER

LOGON offers you this excellent small reliable printer at a low introductory price. Every DP-8000 is complete with the latest features: - Adjustable tractors and 1K input buffer. Standard features include:

- RS232C, current loop and centronics parallel
- 80 columns - 112 char/sec
- 96 char set - 9 x 7 font — Bidirectional printing
- Top of form, skip over perf, out of paper, eight vertical tabs, etc.

Only \$795

Plus \$20.00 shipping and handling.
Terms - check with order - Allow 3 weeks for delivery

Bringing Music Home

Being a spectator is great
...but why not participate?

- Sing along
- Compose
- Play
- Learn from Specialists

LET MICRO MUSIC TURN YOUR APPLE II® INTO A FAMILY MUSIC CENTER!

VISIT THE APPLE DEALER NEAREST YOU AND ASK FOR A DEMONSTRATION OF MMI'S MICRO COMPOSER™

The MICRO COMPOSER LETS YOU—

- Play up to 4 simultaneous voices
- See all 4 voices at the same time you're hearing the music—a must for music editing!
- Enter music notes by a fast, simple and well-tested coding system.
- Program the pitch, rhythm, and timbre of the music. Tempo is varied by the Apple paddle.
- Choose 7 different tone colors for each voice or create your own tone color.
- Compose, edit, display, and play music through an interactive, command-driven language that's easy to learn.
- Save your music on disk or cassette.
- Hear quality music sound at low cost through the MICRO MUSIC™ DAC card. No amplifier needed! Designed for MMI by Hal Chamberlin and Micro Technology Unlimited.
- Select from future MMI music instruction software to accompany the MICRO MUSIC DAC.

The MICRO COMPOSER is an APPLE II® compatible, low-cost music system designed by the folks at MMI. Our music software was designed by leading experts in music education. A simple step-by-step instruction manual leads you through entering, displaying, editing, and playing music with up to four voices—soprano, alto, tenor, and bass. You can change the sound of each voice to reed, brass, string, or organ sounds and you can even color your own music sounds!

HAVE FUN! THE MICRO COMPOSER comes complete with an instruction manual, software disk or cassette—in either Integer or Applesoft ROM BASIC, and the MICRO MUSIC DAC music card. Just plug the MICRO MUSIC DAC into the APPLE extension slot and connect the audio cable to a speaker.

Suggested retail price \$220.

Ask your local dealer for information on MMI products, or contact:

Micro Music Inc 309 W. Beaufort, University Plaza, Normal, Illinois 61761 (309) 452-6991

SELECTOR III - C2

THE INFORMATION MANAGEMENT SYSTEM

Includes these Application Sub-Programs. . .

Sales Activity, Inventory, Payables, Receivables, Check/Expense Register, Library Functions, Mailing Labels, Appointments, Client/Patient Records

Circle 213 on inquiry card.

RANDOM, MULTI-KEY RECORD RETRIEVAL under CP/M, CDOS, IMDOS, ADOS ...

SELECTOR III-C2 ALLOWS INSTANT RECALL OF ANY RECORD USING ANY INFORMATION ITEM IN THE RECORD. That statement deserves re-reading, because that ability makes **SELECTOR III-C2** the most powerful information management system in microcomputers today!

The three major activities in business computing are...Word Processing, Financial Accounting, and the storing, processing, and reporting of information. The latter is where **SELECTOR III-C2** shines and fills the professional and personal need.

The system represents the state of the art using Micro-Ap's unique record indexing, query, and report writing methods. It's 'menu driven' and uses screen displays with all the instructions and error sensing that allow the novice to quickly learn the system and accomplish his tasks.

With **SELECTOR III-C2** you...

- define a record format assigning up to 24 fields as 'key' fields - meaning that records can be instantly recalled by name, date, quantity, ZIP Code, or whatever.
- create a file and begin entering edited and verified data immediately.
- browse through your file in key field order, making whatever changes or deletions needed.
- select collections of records meeting your exact requirements and arranged in the order wanted.
- create a unique report that contains the precise information you need - with numerical totals, averages, maxima, and minima - for any period of time and summarized by name, date...or by any item you want.
- bring an application on-line in hours instead of months.

SELECTOR III-C2 is a 'turn-key' system that can manage most applications as is. It includes source-code and pre-defined record formats and sub-programs to perform the tasks listed at top of page. Programmers can easily add other sub-programs - using the system's powerful utilities - to perform virtually any special computation or function required.

The system runs under CBASIC Vers. 2, and is priced at \$345. It's available in a variety of CP/M, disk formats including Dynabyte; North Star; Micropolis; TRS-80; Helios II; Heathkit; iCOM; Altair; Im-sai; Cromemco; and others.

Available from computer stores worldwide.

DESKS AND STUFF

Computer terminals, business systems, lab components . . . they all need desks and enclosures. That's what we're all about. Computer Furniture and Accessories offers a standard line of furniture suitable for a wide variety of applications. Handsome, rugged, economical furniture in all shapes, sizes and colors. Basic models shipped from stock in days, not months. And we're nice people to deal with. What more could you ask for?

A Beautiful Way To Interface

IQ 140

SOROC's first and foremost concern, to design outstanding remote video displays, has resulted in the development of the IQ 140. This unit reflects exquisite appearance and performance capabilities unequaled by others on the market.

With the IQ 140, the operator is given full command over data being processed by means of a wide variety of edit, video, and mode control keys, etc.

The detachable keyboard, with its complement of 117 keys, is logically arranged into 6 sections plus main keyboard to aid in the overall convenience of operation. For example, a group of 8 keys for cursor control / 14 keys accommodate numeric entry / 16 special function keys allow access to 32 pre-programmed commands / 8 keys make up the extensive edit and clear section / 8 keys for video set up and mode control / and 8 keys control message and print.

Two Polling options available: 1) Polling compatible with Lear Siegler's ADM-2. 2) Polling discipline compatible with Burroughs.

Circle 346 on inquiry card.

IQ 120

The SOROC IQ 120 is the result of an industry-wide demand for a capable remote video display terminal which provides a multiple of features at a low affordable price.

The IQ 120 terminal is a simple self-contained, operator / computer unit.

The IQ 120 offers such features as: 1920 character screen memory, lower case, RS232C extension, switch selectable transmission rates from 75 to 19,200 bps, cursor control, addressable cursor, erase functions and protect mode. Expansion options presently available are: block mode and hard copy capability with printer interface. The IQ 120 terminal incorporates a 12-inch, CRT formatted to display 24 lines with 80 characters per line.

165 FREEDOM AVE., ANAHEIM, CALIF. 92801

(714) 992-2860 / (800) 854-0147

Listing 3: An APL/S program that simulates a game of craps. The game continues until a bet of \$0 is made. Actual play is handled by the subroutine PLAY, which sets WIN to 1 to indicate a win, and to 0 for a loss. The net amount won is stored in NET.

```
PROGRAM CRAPS
  NET=0
  "BET 0 TO QUIT"
  WHILE 1
    DO "PLACE YOUR BET"
      IF 0 GE BET=KEYB
      THEN EXIT
      ELSE "COMING OUT"
        PLAY
        IF WIN
        THEN "WINNER"
          NET=NET+BET
        ELSE "YOU LOSE"
          NET=NET-BET
        ENDIF
      ENDIF
    ENDWHILE
    IF NET GE 0
    THEN "YOU'VE WON"
      NET
    ELSE "YOU'VE LOST"
      -NET
    ENDIF
    "COME.AGAIN SOON"
  ENDPROGRAM
```

Listing 4: The PLAY subroutine used by the CRAPS program of listing 3. A first roll of 7 or 11 wins; 2, 3, or 12 loses. Otherwise, a point is established (the value of the first roll). The dice are then repeatedly rolled until the point is rolled for a win, or a 7 is rolled for a loss. See listing 5 for a sample execution of CRAPS.

```
PROGRAM PLAY
  +DICE=RANDOM 6 6
  PONT=+/DICE
  IF OR/(PONT EQ 7 11)
  THEN "PASS"
    WIN=1
  ELSE WIN=0
    IF OR/(PONT EQ 2 3 12)
    THEN "CRAPS"
    ELSE "YOUR POINT IS"
      PONT
      WHILE 1
        DO +DICE=RANDOM 6 6
          IF +/DICE EQ PONT
          THEN "POINT MADE"
            WIN=1
            EXIT
          ELSE
            IF +/DICE EQ 7
            THEN "BUSTED"
            EXIT
          ENDIF
        ENDIF
      ENDWHILE
    ENDIF
  ENDWHILE
  ENDIF
  ENDPROGRAM
```

Listing 5: Sample execution of CRAPS.

```

?0
YOU'VE WON
150
COME AGAIN SOON
```

Text continued from page 94:

A simple program (AVE) using the array facilities is shown in photo 2 as it would appear to the user. The program computes the average of a set of observations. An execution of AVE is shown in photo 3.

The final example uses both the structured programming and array features for a simple game of craps. The main program is shown in listing 3, a subprogram in listing 4, and a sample execution in listing 5.

Both the main program and the subprogram use an EXIT statement to end a loop based on a condition detected inside the loop. The single entry, single exit convention of structured programming is maintained by this highly restricted type of GOTO.

The subprogram PLAY (listing 4) contains examples of using the array features for logical testing, a use which is not obvious in the numeric computation context usually employed in explaining the array features. Such non-mathematical use of the array features is common in APL programming, although in APL it is used in conjunction with a kind of conditional GOTO. The evaluation of the expression IF OR/(PONT EQ 7 11) will be followed through its intermediate results.

Although the purpose of the statement is logical testing, the execution trace will show how the statement is, in its use of the array features, similar to the expression for net present value. For tracing, let PONT=9.

IF OR/(PONT EQ 7 11)
 IF OR/(9 EQ 7 11)
 IF OR/(0 0)
 IF 0 OR 0
 IF 0

The result, 0, indicates that it is false that PONT equals 7 or 11, so execution will proceed to the first statement of the ELSE block.

Summary

APL/S is one of the first high-level language alternatives to BASIC to be offered on a low-priced personal computer (under \$800). APL/S combines structured programming with an APL approach to arrays. Additional differences between APL and APL/S are due to hardware limitations and a desire to make use of the language as natural as possible. ■

An APL/S language system is available in a read-only memory cartridge for the VideoBrain home computer from VideoBrain Computer Co, 2950 Patrick Henry Dr, Santa Clara CA 95050.

New Robotype™

Turns your typewriter into a quality output printer!

- easily connects to any computer
- serial and parallel interface
- all electronics included—ready to use from package
- connects to IBM Selectric II typewriter in just one minute
- adapts to a variety of typewriters—no modifications
- compatible with Radio Shack TRS-80, Apple II, Pet, etc.
- Centronics interface compatible
- available from stock in 30 days

Put a Robotype to work on your typewriter for under \$1,000. Call (614) 436-3163 today!

Dealer, distributors, and word processor OEM inquiries welcome.

Low Power 32K RAM for Heath® H8 computers

DG-32D 32K RAM FEATURES:

- ✓ Plugs into Heath® H8 Computer
- ✓ Ready to use. Fully assembled, tested & burned in
- ✓ Operates with existing Heath memory
- ✓ Protected Memory Output Buffers in the event of Address error.
- ✓ Utilizes popular 4116 RAM devices
- ✓ Memory Address DIP switch changeable
- ✓ Arranged as 4 Independent 8K Blocks
- ✓ Low Power Consumption: Less than 6 watts, typical
- ✓ Transparent Refresh
- ✓ One year guarantee
- ✓ Compatible with all current H8 peripherals.

Heath® and H8 are registered trademarks of the Heath Corporation, Benton Harbor, Michigan.

D.G. ELECTRONIC DEVELOPMENTS CO.

\$479

D•G Electronic Developments Co. brings you a totally compatible, fully assembled and tested 32K RAM for Heath® H8 computers. The DG-32D has less than 6 watts power consumption. This allows you to add a full 32K bytes of Random Access Memory without taxing or replacing your computer's power supply. Engineered to plug-in and run without any user modifications, the DG-32D can be used with or without existing H8 RAM without modification. Protection of the memory output buffers is provided in the event of assigning two blocks to the same address space. The DG-32D is the ideal answer to expansion of the Heath H8 computer . . . Low power consumption, low price, high capacity, total engineering and exacting production methods.

Ordering Information: DG-32D RAM available only from DG Electronic Developments Co., P.O. Box 1124, 1827 South Armstrong, Denison, Texas 75020. Check, money-order, VISA or Master Charge. Phone orders accepted on charge orders. NO COD's. Foreign orders add 30%. Texas residents add 5%. For VISA or Master Charge orders call 214-465-7805. \$479.00 freight prepaid.

BYTE's Bits

Computer Simulates State Prison System, Helps Predict Cost

Louisiana State University (LSU) has designed several computer models that simulate the operation of the state's prison system. The computer models can determine the cost of building and staffing new prison units, the costs of prisoner transfer, and the costs that any changes in duration of stay or in legislation affecting probation or sentencing might have. With the University's IBM computer at their disposal, lawmakers can propose various pieces of legislation, send it to LSU for analysis, and receive a response within 48 hours. For further information, contact IBM, 7701 Stemmons Fwy, Dallas TX 75247.

Apple Computer Introduces a Repair Service

Apple Computer Inc, 10260 Bandlely Dr, Cupertino CA 95014, has announced a nationwide repair program featuring same-day computer repairs.

Level I repair requires no special technical knowledge and will be dealt with by a local dealer using new diagnostic software and Apple's Modular Parts Exchange Program (MPEP).

The diagnostic program tests the motherboard, power supply, memories, keyboard, tape I/O, paddles, disk drive, and peripheral interface cards. When the problem is located, the diagnostic program identifies it and informs the dealer, through the video display, which component needs repair or replacement. The Level II (more complex) repairs will take place at a regional distributor, and Level III ser-

vice will originate from the Apple Service Center in Cupertino CA.

A California School District Uses Computers

Five hundred and fifty boys and girls from elementary grades and the six high schools in the Huntington Beach school system are now using a powerful IBM System/370 Model 135, which is reserved exclusively for instructional purposes. The students take courses in mathematics, science, social studies, business, English, and computer programming languages in teacher-supervised classrooms on 56 terminals. A group of high school students wrote a series of online programs to carry all scoring and results of an academic decathlon hosted by a Huntington Beach high school. One student wrote a program to survey all county school professional salaries. Another 7th grade pupil won the county science fair with a computer project. Children can develop their own academic computing programs and make any program selection they want. For further information, contact Glen Dysinger, 5201 Bolsa Ave, Huntington Beach CA 92647.

LSU Professor and Computer Develop New Ways to Deal With Environmental Problems

An IBM 3033 processor and Richard C Farmer, professor of chemical engineering, are solving complex equations devised in the 1880s that describe the motions of solid particles in fluids. Computed results may show where to deposit sediment from dredging operations that are necessary

We're about to make a new name for ourselves.

Not that the old one was so bad. As Ithaca Audio, we've made quite a name for ourselves. As the source for CPU, memory, video display and disk controller boards to upgrade other makers' mainframes and peripherals. The company that makes those neat little RAM expansion kits. And the folks behind the world's only Z-80 Pascal compiler.

But as much as we've enjoyed improving other people's equipment, we've been quietly moving towards larger endeavors, with a lot of encouragement from our customers. Listening to people's problems, as well as their needs. And, as a prime mover behind the IEEE S-100 Bus Standard, answering some really knotty questions.

One of the results is our new identity. And our first new product: the Inter-system's DPS-1. An IEEE S-100 compatible mainframe with features that live up to its looks. Dependable operation to 4 MHz. Twenty-card capacity. A modular power

supply. And something no one else has — built-in breakpoints to give you a faster, more powerful tool for testing software as well as hardware. *Directly* accessible from an easy-to-use front panel that's as *reliable* as it is functional. In short, an intelligently-designed computer for the intelligent user.

There's a lot more to Intersystems. In hardware. And software. All available through the nationwide dealer network we're now assembling.

You can watch this magazine for updates. Or contact us directly for straight, friendly answers and detailed information from key staff people. Just the way you always have. Because even though we're making a new name for ourselves, we'll never forget who made it possible.

NOW . . . DISCOVER
16-BIT MICROPROCESSORS!

MICROPROCESSOR LEARNING PACKAGE

UNIVERSITY MODULE

We offer TI's 16-bit educational module and back it up with support products and services to provide a complete learning package. The University module includes: 16-bit microprocessor; on-board alphanumeric terminal and 10-character, 7-segment alphanumeric display; firmware-resident debug monitor and symbolic assembler; audio cassette interface; user-addressable LEDs; 16-bit programmable I/O controller; optional EIA and TTY interface; 4K bytes of ROM (expandable to 6K) and 1K bytes of RAM (expandable to 2K).

MEMORY AND I/O EXPANSION MODULE

To make the University module even more useful, we designed the Expansion module to provide 8K bytes of additional memory! It has sockets for 8K bytes of EPROM and sockets for 8K bytes of static RAM, which are address configurable on 1K byte boundaries. Included is an EPROM programmer for TI 2708's and 2716's. This module is the mother board for 15 additional 32-bit I/O expansion ports.

DOCUMENTATION PACKAGE

To support your hardware and software, we offer the 550-page textbook, *Introduction to Microprocessors*. Included in the book are exercises and lab experiments designed specifically for the University module. Application notes are available, along with a set of demonstration programs on audio cassettes. Courses and workshops are also offered. Write or call today for more information on dates and times.

Buy through GGA, Inc. and save! University module with demonstration programs on audio cassettes — \$299. Memory and I/O Expansion module — \$199. Power supply for University module — \$65.

George Gandy & Associates Inc.

to maintain shipping lanes, without endangering precious oyster beds. Professor Farmer hopes to find a way to halt the silting that blocks shipping, without creating other environmental problems. Before a computer approach was developed, marine scientists had to depend on photos and dyed water, and civil engineers used scale models to study environmental problems. The Tennessee Valley Authority uses Professor Farmer's approach to determine optimum methods, from an environmental standpoint, to dispose of the waste heat from power plants. The Louisiana State University, Office of Information Services, Baton Rouge LA 70803 has more information on computer-assisted programs in environmental studies.

Short Course Series

Integrated Computer Systems Inc, 3304 Pico Blvd, POB 5339, Santa Monica CA 90405, has announced their winter and spring schedule for their Short Course series. Courses on computer graphics, digital signal processing, troubleshooting microprocessor systems, and other topics will be covered. The courses are being held in major cities around the US. These courses are structured for technical and managerial personnel.

Computer Courses for Nonspecialists

Human Computing Resources Corp is presenting short courses on introductory programming in BASIC, programming in Pascal, introduction to computing and personal computers and microprocessors, how to buy a computer for a small business, computer graphics, word processing, computers in law and medicine, and more. For price and schedules

for the next year, contact Human Computing Resources Corp, 10 St Mary St, Toronto Ontario, CANADA M4Y 1P9.

Call for Papers

The Instrument Society of America (ISA) is sponsoring a conference on the theory, design, manufacture and use of instrumentation, computers and systems for measurement and control entitled "Instrumentation of Challenge," to be held October 20-23, 1980, in Houston. Papers concerning theory, applications, technique or innovations in the fields of aerospace, analysis, cryogenics, data handling and computation, metals, power, textiles, pulp and paper, maintenance, biomedical, and more, are welcome.

To submit a paper for consideration, request abstract forms from ISA headquarters, 400 Stanwix St, Pittsburgh PA 15222. Deadline for unsolicited papers is February 1 1980. ■

BYTE's Bugs

Some Refreshing Bugs

Thanks go to Steve Ciarcia for uncovering several bugs in his October 1979 BYTE Circuit Cellar article, "Self-Refreshing LED Graphics Display." In figures 2 (page 59) and 4 (page 62) the light-emitting diodes (LEDs) are shown with their polarities reversed. For proper operation, they should be reversed from their appearance in the figures. Also, in figure 2 the signal decode I/O write strobe is shown as a high-to-low transition. It should be a low-to-high transition for proper operation. ■

BYTE News . . .

FCC TO ALLOW ASCII COMMUNICATION VIA OSCAR: The Federal Communications Commission (FCC) has granted the American Radio Relay League (ARRL), the largest amateur radio association in the world, a waiver to allow ASCII communications via the OSCAR satellite. Radio amateurs who have personal computers will soon be able to transmit and receive ASCII anywhere in the world. The waiver covers "experimental use only," as there are still some problems. The problems involve radio frequency (RF) interference in the satellite receiver and a lack of a clear-cut protocol for the ASCII format. Progress is being made in solving these problems, and it is expected that amateurs will utilize this service heavily.

UNIX-LIKE SYSTEM AVAILABLE FOR 8080/Z80 SYSTEMS: An operating system modeled after UNIX (registered trademark of Bell Labs) is now available from the Computer Systems Design Group, 3632 Governor Dr, San Diego CA 92122. UNIX is a high-level, timeshare operating system developed by Bell Labs to run on large DEC PDP-11 systems. It has proven very popular at educational institutions, research organizations, and the like, because of its power and flexibility.

COMPUTER BULLETIN BOARDS MULTIPLY: Computerized bulletin board systems are multiplying like rabbits! These systems, which allow people to communicate with others via terminal/modems and personal computer systems, are skyrocketing in popularity. From only three computerized bulletin board systems in operation at this time last year, their number has increased to nearly 60 systems in operation across the country. These systems are run by individuals, clubs and businesses who are using the computerized bulletin board systems' software to set up computerized intelligent answering machines. Many are tailored to the special needs of the sponsors by altering the software. California has nearly twenty computerized bulletin board systems in operation and Texas approximately ten. A majority of the computerized bulletin board systems can be contacted via computer club newsletters.

NEWS BRIEFS: Bell Labs, Murray Hill NJ, has fabricated experimental bubble memory chips with 11.5 M bit density to yield working storage of at least 1 M bytes . . . Bell Labs has also announced an extension of the conventional doping methods used in manufacturing integrated circuits that could double their speed . . . National Semiconductor, Santa Clara CA, has announced a CMOS microprocessor which executes the Z80 instruction set. However, it is not pin-compatible with the Z80 . . . Texas Instruments is the leader in microprocessor production. So far they have made over 9 million TMS-1000 microprocessors. The TMS-1000 is a 4-bit processor used mostly in toys and games.

8-INCH HARD DISK DRIVE MARKET SHAPING UP: It is now apparent that manufacturers are going to use the new 8-inch hard disk drives in a big way next year. The 8-inch hard disk drives will fill a gap that exists between floppy drives and the 14-inch hard disk drives. The IMI-7710, made by International Memories Inc, Cupertino CA, is the only drive currently in production. IMI appears to have at least a 6-month, and possibly greater, lead on the rest of the manufacturers. The 7710 stores 11 M bytes and sells for under \$2000 in quantity (\$2990 for a single unit).

At least a dozen manufacturers will have 8-inch hard drives in production by the end of the first quarter of next year. They will range from 2.1 M bytes all the way up to 51 M byte units, with prices ranging from \$1900 to \$4000 in single-unit quantities. Shugart will be a late entry into this market and is keeping development efforts under wraps. However, Shugart is expected to introduce a very low-cost small storage size drive.

It is expected that manufacturers of double-sided floppy drives will have all the bugs solved in 1980 and that these drives will hinder the low-end, 8-inch hard disk drive market. On the high-end, the 14-inch hard disk drives, although physically larger, have a lower cost per bit and hence may limit the growth of 8-inch drives. It is expected that the more popular 8-inch hard disk drives will be in the 5 to 20 M byte range.

RANDOM RUMORS: General Electric is interested in the personal computing area. They have invested some money in Intelligent System Corp (ISC), the maker of Compucolor systems. But they have not decided on their approach . . . Shugart is producing 1000 5-inch floppy disk drives per day, while Micropolis, ranked second in the industry, is turning out 200 per day . . . A 2 M byte

5-inch floppy disk drive will be announced this coming spring by Tandon Magnetics, Chatsworth CA. The drive will be double-sided and double-density with 96 tracks per inch and 12,000 bits per inch.

16-BIT MULTIPROCESSOR UNIT PERIPHERAL INTEGRATED CIRCUITS BEING INTRODUCED: All of the 16-bit microprocessor manufacturers are introducing peripheral integrated circuits which increase the power and flexibility of the new 16-bit microcomputer systems. These integrated circuits will allow these microcomputers to take over applications once considered the province of mini or large computer systems. These include memory management (MMU), bus arbitration, direct memory access (DMA), and floating point arithmetic. Also being introduced for the 16-bit devices are dual-density floppy disk, bubble memory, and super fast printer controllers.

The memory management unit allows the microprocessor to partition off its own memory space. Motorola and Zilog plan to have memory management unit integrated circuits for their 68000 and Z8000 multiprocessor units, while Intel includes the memory management unit with their 8086 16-bit multiprocessor unit.

Bus arbitration controllers are used in multiprocessor systems where there is more than one master unit on the bus. The bus arbiter provides the necessary timing and control signals, including establishing priorities among masters. Intel has already announced such an integrated circuit and Motorola and Zilog are designing theirs.

AMD has released its arithmetic processor which performs single-precision (32-bit) and double-precision (64-bit) add, subtract, multiply, and divide operations with 16-bit wide data paths.

WHAT'S AHEAD FOR 1980?: This is a good time to make some predictions for next year. What can we expect? Let me stick my neck out a little. I expect to see the following:

- The first Japanese personal computer systems will become available in this country.
- Competitive pressures will increase on small manufacturers. This will cause some liquidations and several mergers, consolidations or acquisitions.
- A sizable number of audio and office equipment retailers will enter the computer retailing business. This will create pressures on conventional computer stores. We may even see the appearance of stores that sell only software, much like audio record stores.
- 16-bit microcomputer systems will be commonplace. They will have multiuser, multitasking and multiprocessing, and greater real-time operating capabilities. They will offer far more sophisticated editors, debuggers, compilers, assemblers, and other system software.
- IBM, Digital Equipment Corp, Data General, Hewlett-Packard and other minicomputer makers will introduce low-cost microcomputer systems to compete with current microcomputer systems.
- Several personal computer manufacturers will introduce "second generation" machines with significant increases in power.
- The emphasis will shift from hardware to software. BASIC will continue as the dominant language. Enhancements will continue to be made to the available BASIC interpreters. BASIC compilers will be more available. Pascal will increase in popularity, but will still be used by only a small percentage of system programmers. New COBOL compilers will also become available and increase in popularity. APL will also increase in popularity, particularly for financial and statistical applications. Also a large number of data base managers will be introduced.
- Business application software for microcomputer systems will finally "come of age" and provide the needed performance that suppliers have been promising but not delivering during the past two years.
- The first low-cost microcomputer-based robot kit will be introduced.
- Typewriters will have built-in intelligence, using microprocessors and built-in microdisks naturally, and will have many word processing features. They will be able to store 10 to 50 pages of text. The "dumb" typewriter will soon be a thing of the past.
- Personal computer time-sharing systems will proliferate. The greatest use will be for accessing data bases.

MAIL: I receive a large number of letters each month as a result of this column. If you wish a response, please include a stamped, self-addressed envelope.

The body's beautiful, but you'll love your Companion for her mind!

INTRODUCING THE PERSONAL GENIE: COMPANION I & II

Beneath her beautiful teakwood roll-top desk exterior, there beats a heart of pure Radio Shack TRS-80 Microcomputer.

But don't let her good looks fool you. Your Genie has a brain that's right at home in your office, home, classroom or laboratory.

Two versions are available, each designed around the TRS-80 system with video monitor, keyboard, cassette recorder, expansion inter-face, mini-disk system and printer.

Both include the latest version of the TRS-80 disk operating

system, disk BASIC and Level II BASIC as well as the assurance of Radio Shack's reputation, warranty and national service network.

The Companion I features 16K of memory, the TRS-80 Quick Printer I and a single mini-disk drive.

The Companion II highlights include 32K of memory, the TRS-80 tractor feed line printer and dual mini-disk drives.

Either version can be expanded to accommodate additional memory and mini-disk drives.

And we haven't forgotten her brain food either. A full set of cassettes, diskettes and paper

accompanies the clear and concise instructions of the Companion User's Manual. All this brain matter comes pre-assembled in a body you can love and live with.

The perfect Companions from PRODATA.

PRODATA, INC.

Companion Computer

Companions I & II are competitively priced at \$3,495 and \$4,995 respectively, FOB Ft. Worth, Texas, and ready for immediate delivery. PRODATA will pay the air freight charges on all prepaid orders within the Continental U.S.A. For more information call Toll free 800-367-7050 Ext. 1811 or write PRODATA, Inc. 98-1122 Kahapili Street, Aiea, Hawaii 96701, Telephone 808-488-5348. Assembly Office: 3620 Lake Pontchartrain Drive, Arlington, Texas 76016.

Text Compression

James L Peterson
Dept of Computer Sciences
University of Texas
Austin TX 78712

A continuing problem on any computer system is storage. There is never enough computer memory for all the information we wish to store. This is true both for programs in main memory and for the information which resides on peripheral devices.

One solution to this problem is simply to buy more memory. Particularly in the case of storage devices with removable media such as cassettes, floppy disks, magnetic tape and even paper tape, additional media can be purchased and used as necessary. But even here economics will eventually limit the amount of storage available.

An alternative approach is to try to make better use of existing storage media. This is where *text compression* can be of great use. The idea of text compression is to reduce the amount of space needed to store a file by compressing it, making it smaller.

Compression is accomplished by changing the way in which the file is represented. The *encoding* procedure is performed in such a way that it is reversible; that is, it can later be *decoded* to produce the original uncompressed file. This is illustrated in figure 1. The hope is that the encoded version of the file will be smaller than the original file, and hence space will be saved.

The cost of this space saving is processor time. Additional processor time will be needed to encode and decode the compressed files as they are processed. However, it should be noted that microprocessors are seldom processor bound, but more commonly have extra processor cycles available. In fact, the total execute time of many programs will be less on a compressed file despite its encoded form. This is because the I/O(input/output) transfer time for a compressed file is less than the

transfer time for an uncompressed file, since there are fewer bits to read or write. Hence, I/O bound programs (like assemblers and loaders) may execute faster on compressed files.

The basic idea of text compression is to find an encoding method that takes up minimal space. Many algorithms for text compression have been invented, and we present some of them here. In general, these algorithms will work for any type of data, such as numeric, character string, and so on; but for purposes of this article we limit ourselves to text, ie: strings of characters. This will include programs, documentation, mailing lists, data, and many other files stored in computers. In fact, object programs, if considered as simply strings of bytes, can also be compressed, although this must be done carefully.

Text compression is accomplished by careful selection of the *representation* of the information in the compressed file. For many small computer systems, the ASCII code is generally used to represent characters. The main advantage of the ASCII code is that the representation is standard and easy to define. A major disadvantage is its poor space utilization. ASCII is a 7-bit code, while most processors handle 8-bit bytes. Thus, 1 bit out of 8 (12.5%) is wasted simply because a 7-bit character code is used in an 8-bit byte. Further, most control codes are seldom used, and many applications do not need both upper and lower case characters. Thus, another bit can generally be reclaimed with ease, providing at least 25% savings in storage space. Many of the algorithms presented here can turn these extra bits into even greater savings of space.

Notice, however, that this approach requires a description of how the compressed file is to be represented. This description commonly consists of the encoding and decoding routines. The savings which result from text compression must be balanced against both the additional processor time for encoding and decoding, and the storage space necessary for the encoding and decoding routines. Also, different types of files may be best encoded by different methods, so several different encoding and decoding routines may be necessary.

Figure 1: The text compression process.

Do TRS-80's new lower prices mean you get "cheaper" computers?

No Way!

Here's why . . .

Production costs drop and manufacturing efficiency rises when you deliver more than 100,000 TRS-80™ Model I systems built in your own factories in less than two years. No other computer — ever — has had customer acceptance on such a scale.

Sure, TRS-80 Model I is the price leader, but then you know better than to make your decision based on price alone. You've got to be convinced you get 1) full quality and features, and that 2) our more than 100 service locations furnish faster service, and that 3) we continue to add new software and hardware for TRS-80, even though our list is already one of the industry's longest.

Level I — 4K

"Chess Challenger-10 Wins Microchess Tourney"

—Personal Computing Magazine
February, 1979

"Its successor, the new Chess Challenger-7, is infinitely more powerful!"

**JUST RELEASED
VOICE CHALLENGER**

—S. Samole
President, Fidelity Electronics

Genius Offspring

Chess Challenger-10 did more than win the Penrod Memorial Microchess Tournament, it literally trounced all opponents. Personal Computing Magazine, February, 1979, reports, "Chess Challenger-10 emerged as the easy victor with ten wins, two draws and no losses."

All Top Name Performers

There were no amateurs in the championship playoff. Every contender bore the brand of a well-known electronic chess game, and each was accompanied by its entourage of coaches, programmers, and engineers. After each contestant had played all of the opponents in round robin fashion, the brilliant Challenger-10, stood far ahead of its second place runner-up.

Nobody Knew

Unknown to the other companies, the undefeated tournament leader was being retired after the contest. Taking its place was a far more powerful chess computer, the Challenger "7." This new micro-computer had already beaten the official undefeated champ during a series of pre-tournament warm-up games at the factory. Its engineers explain that it is simply 14 months ahead in technology, in finer algorithm sophistication and in its superb performance.

Improve Your Game to Near Brilliant

Within its seven different levels of play, you can enjoy every degree of chess competition, from beginner to tournament skill. Its total flexibility lets you change games mid-stream or switch sides with the computer to see how it would handle your dilemma. You can add pieces to your side or take away the computer's Queen. It is a superb teacher!

Touch the PV key and the "7's" total recall memory will verify every piece position on the board. You can even set up hypothetical encounters to test its reaction at each level.

Fidelity's Challenger "7" is able to analyze over 3,024,000 board positions. It masterfully handles over one thousand book openings and will respond to any deviation. Academic openings as Sicilian, French, Ruy Lopez and Queen Gambit Declined, are just some of the challenges to keep you on your toes.

It Knows Every Rule in the Book

The Challenger "7" will permit you to castle or perform an En Passant capture or do so itself, if that is its best move. When your pawn has reached the eighth rank, it will be automatically raised to a Queen, unless you tell the computer to promote it to another piece. It will take on any player and sharpen his skills considerably... but it won't permit illegal moves.

At Level 1, its average response time is 5 seconds. At Tournament Level 7, the Challenger makes championship decisions in just 3 minutes.

Unbeatable in Price As Well As Play

Best of all, the Chess Challenger "7" is just \$89.95 complete with chessmen and UL approved 110V AC adaptor.

All pieces are magnetized, to stay where you place them on the permanent metal board. The set is mounted in a simulated wood-grained housing which measures 12 1/8" x 8" x 1". Bright, one-half inch tall LED electronic digits, provide unmistakably clear readout.

A MAJOR ADVANCE VOICE CHESS

Brand new from Fidelity—the granddaddy of them all. VOICE CHALLENGER. It may look something like the "7," but it's a great deal more. Increased microprocessor brain offers all of the 7's ability plus three additional levels beyond the seven: *Excellent* (6 minutes), *Expert* (11 minutes) and *Infinite* (from 5 seconds to days). But, you needn't wait days. You can command this level to move at any time. So many readers have asked for *maximum skill*. This is it.

Most incredible, it TALKS. In addition to its display, an electronic miracle of voice synthesis permits this phenomenal Challenger to speak. It's not a tape, but a computer-created voice distinctively announces each move it makes. It verbalizes your moves, too. It has a vocabulary of over 50 words which will also suggest a move for you if you take too long.

If the Voice Challenger is about to set up a mate-in-two offense, it will flash, "Mate-in-Two." From here on, you'd better be a whiz to avoid defeat. This set (same size as "7") comes in a black enameled hardwood cabinet. Hand-carved Staunton pieces in tan and black are magnetized to stay put. The unit is complete with a durable ABS carrying case.

Both units are backed by a 90-day manufacturer's limited parts and labor warranty.

PLAY CHESS FOR 10 DAYS AT OUR EXPENSE

As a gift or for yourself, the "7" and the "Voice" are unquestionably the finest chess computers you can select... but, if within 10 days, you are not pleased, return your purchase for a prompt refund.

Figure 4: Compressing a BASIC program by using keyword replacement. The keywords (1) GO TO, (2) IF, (3) LET, (4) PRINT, (5) READ, (6) THEN and (7) END have been replaced by an escape sequence consisting of an escape character \$ followed by a keyword number. Note that the escape character occurred within the original program and was replaced by a special escape sequence \$\$.

acters by a special escape sequence such as one with a 0 count; replace all escape characters by an escape character, a count of 1, and an escape character, treating it as a sequence of length 1. Any of these approaches will allow a file to be encoded and decoded easily and correctly.

Note that, in choosing an escape character, we can always use the same one (a system-wide constant) or we can select a different one for every file. If we choose a different one for every file, we must make a preliminary pass through the file to look at all characters used and find one which is not used. We should then append the escape character at the beginning of the file to allow the decoding algorithm to know what character is used as the escape character.

Keyword Replacement

A very common type of file stored in computer systems is a program file. Programs offer great possibilities for

text compression because of their stylized form and syntax. The techniques of deleting trailing blanks and using tabs to replace leading blanks can reduce storage requirements considerably. But an even larger gain can be made from keyword replacement.

Most programming languages use a number of *keywords* or *reserved words*: in FORTRAN, such words as INTEGER, FORMAT, CALL and so on; in BASIC, such words as LET, READ, PRINT, REM and so on. These words are used throughout these programs and are prime candidates for text compression.

Two techniques are commonly used. First, one can replace each keyword by an escape sequence. The escape sequence might consist of the escape code, followed by a number which indicates which keyword is being used. This has the advantage of allowing a large number of reserved words up to the number which can be held in 1 byte, and can be particularly

useful for assembly language symbolic op codes.

An alternative approach is to look through the existing character code for unused character codes. For example, if ASCII is being used, many of the control codes, some of the special characters, and perhaps the lower case characters are not normally used. If 7-bit ASCII is being used with 8-bit bytes, then the extra bit can be used to define 128 new unused codes. These unused codes are paired up with the most frequently occurring reserved words. One code should be reserved for use as an escape or quote character, in case any of the codes assumed to be unused should happen to be used in an input file.

For encoding, the input file is scanned for reserved words and each reserved word is replaced by the appropriate special code as illustrated by figure 4. If any of the special codes should show up in the input stream, they are replaced by the 2-character sequence of the escape code followed by the input character. For decoding, all special codes are replaced by their equivalent keyword, except that any character preceded by an escape code is copied directly to the output, with no replacement.

At this point, a problem may become apparent. Note that the keywords for any particular language are fixed and relatively small in number, but that the keywords vary from language to language. Hence, the appropriate correspondence between special codes and reserved words may vary greatly. In single language systems (such as those which offer only BASIC) this is not a problem, but more general systems need to consider this problem.

Cmc

PET ANALOG INPUT

DAM SYSTEMS

Analog to Digital Conversion System for the Commodore PET Computer

Give the PET the ability to sense, measure, and control the world around it with DAM SYSTEMS modules. Just, plus the PETSET1 into the PET to set 16 channels of analog input. Screw terminals are provided for each channel so you can hook up Joysticks, Pots, or whatever appropriate sensors you have. Each of the 16 analog inputs, in the range of 0 to 5.12 volts, is converted to a decimal number between 0 and 255 (20 millivolts per count). Conversion time is 100 microseconds.

In addition, the PETMOD provides two IEEE ports and one user port as well as a DAM SYSTEMS port.

Software is provided. A one line program is all that is necessary to read a channel.

PETSET1

- 1- AIM161 - 16 ANALOG INPUTS-8 BITS-100 MICROSEC
- 1- PETMOD - PET ADAPTER-2 IEEE PORTS-1 USER PORT-1 DAM SYSTEMS PORT

INTRODUCING THE RAINBOW 2000... THE PERIPHERAL WITH THE BRIGHTEST COLOR GRAPHICS SINCE VINCENT VAN GOGH!

The Rainbow 2000 is the first of a new generation in color peripherals providing a cost effective way to upgrade to full color and high resolution graphics.

By using standard RS 232 C communication interfacing, we made the Rainbow 2000 adaptable to any existing mini or advanced system. A Built-in 6K RAM memory allows the Rainbow 2000 to "stand alone" using just a keypad and color monitor, or it can be utilized with multi-

*TRS-80 is a registered trademark of Radio Shack, a Tandy Co.

terminal systems.

When we at Digitus designed the Rainbow 2000, we had the industrial and scientific user in mind, so we didn't skimp on the specs. We test each board extensively before it is packaged for sale, we use prime quality parts and we back each board with a full one-year guarantee.

So whether you're plotting family expenses on your *TRS-80, or monitoring a factory with an *IBM 370, let the Rainbow 2000 be your step up to color graphics.

*IBM 370 is a trademark of International Business Machine Inc.

The Rainbow 2000, Vincent would have given his right ear for one!

solutions are available. One can simply use separate encoding and decoding routines for each language, leaving it to the programmer to use the appropriate one. Second, one can tag each compressed file with a byte which indicates if this is a BASIC compressed file, or a FORTRAN compressed file, or a type X compressed file. Then the encoder must either be told how to encode the file or be able to guess (or compute) that it is a FORTRAN, BASIC, or type X file and apply the appropriate compression algorithm. The compressed file is tagged as it is encoded. The decoder looks at the tag and uses the appropriate decoding scheme.

A third approach is more general, but potentially more expensive. The difference between the encoding and decoding algorithms for the different types of files is simply the table of pairings between keywords and character codes. Therefore, another approach is to prefix each compressed file with a dictionary of character code and reserved word pairs. The dictionary explains the meanings of the special character codes by indicating the reserved words for which they stand.

Substring Abbreviation

The idea of appending an abbreviation dictionary to the front of a compressed file opens the way to using the keyword replacement scheme for more general files. The idea is quite simple. Pick out those sequences of characters which occur most frequently in a file and replace them with a special character code. To allow decoding, we append a dictionary at the beginning of each file to show which special character codes

```
Dictionary:  $A "the"
              $B "text compression"
              $C "computer"
              ...
```

```
Text:        This paper is concerned with $A use of $B in $C systems, where $A amount of $C storage is
              limited.
              ...
```

Figure 5: Text compression by substring replacement. Substrings are replaced by abbreviation codes (here we use escape sequences). A dictionary is placed at the beginning of the file to define the meanings of the abbreviations.

correspond to which replaced character strings. This approach can yield very good text compression, especially for programs or natural language text, since keywords, variable names and some words (like *the*, *and*, and so on) are used very frequently.

But there are some problems with this approach also. The major problem is selecting the character strings to be abbreviated. With programs written in particular languages, keywords occur frequently and so are a safe bet for substitution, but what constitutes appropriate character strings for general replacement? These can be determined only by examining the file, since the appropriate strings will vary from file to file.

The objective, of course, is to realize the greatest savings in space. Here we are limited mainly by the number of codes available for substitution. If we use unused codes in the existing character set, we are limited to from 10 to 50 abbreviation codes, typically. If we extend the character set (say by using 8-bit codes with 7-bit ASCII) then we may have as many as 128 codes available. Using an escape sequence may provide up to 256, but at a cost of at least 2

characters per abbreviation. In all cases, the number of codes available will always be limited to, say, *m*. Thus we need to pick those *m* strings for abbreviation which will result in the greatest space savings.

We do not always want to pick merely the most frequently occurring *m* strings. Consider the 2 strings to *and text compression*. If *to* occurs 100 times and *text compression* only 15 times, which should we replace? Replacing the 2-character sequence *to* by a single abbreviation code saves only 1 character (assuming 1 byte abbreviation code) per occurrence, or a total of 100 characters. Replacing the 16-character sequence *text compression* saves 15 characters per occurrence, or 225 characters total. Thus, in general we wish to replace that character sequence whose product of length and frequency is greatest. An example of substring replacement is shown in figure 5.

The encoding problem then becomes that of finding the *m* sequences whose length-frequency product is greatest, replacing all occurrences of them with the *m* abbreviation codes, and appending the abbreviation dictionary at the front of the compressed file. The decoding problem reduces to

CHESS-8

Chess for the Heath H-8 computer. CHESS-8® transforms your computer into a challenging chess playing opponent. Multi-level play options match CHESS-8® to your playing ability. Plays full U.S. Chess Federation rules, including castling, "en passant" capture and pawn promotion. Does not permit nor make illegal moves!

Use your CRT terminal to input moves using modified chess notation, display board status or game move summary. Order today and match your skill against CHESS-8®. Supplied on disk with complete instructions, requires HDOS. Send \$24.95 to QC Systems . . .

TARBELL VDS-II

Vertical Disk Subsystem

SYSTEM INCLUDES:

- 2 Siemens 8" Disk Drives
- 1 Cabinet with Fan and Power Supply.
- 1 Tarbell Floppy Disk Interface, assembled & tested.
- 1 CP/M Disk Operating System.
- 1 Tarbell BASIC.
- All Cables and Connectors.
- Complete User Documentation.
- Fully factory assembled and tested.

VDS-II Single Density . . . \$1888
 VDS-IID Double Density \$1999

TARBELL DOUBLE DENSITY INTERFACE FOR 8" FLOPPY DISK

Under Tarbell Double-Density CP/M, single and double density disks may be intermixed. The system automatically determines whether single or double density is in place.

- Software select single or double density.
- Phase-locked-loop and write precompensation for reliable data recovery and storage.
- On-board phantom bootstrap PROM is disabled after bootstrap operation so all 64K memory address space is available to user.
- DMA in single or double density permits multi-user operation.
- Extended addressing provides 8 extra address bits, permitting direct transfers anywhere in a 16 megabyte address range.
- Select up to 4 drives, single or double-sided.
- New BIOS for CP/M included with interface on single-density diskette.

Double Density Interface only, assembled & tested. . . . \$425.

CP/M is a registered trademark of Digital Research.

merely reading in the abbreviation dictionary and replacing all abbreviation codes with the appropriate character sequence.

The only real difficulty is finding the *m* sequences to be abbreviated. No really good solution to this problem is known. The best solution I have seen works as follows: first, make 1 pass through the file to compute the most frequently occurring pairs. There should be no more than 2500 of these, and probably many fewer. Compute the frequency of these pairs and keep only the *m* or *2m* most frequent. Now consider that any sequence of length 3 both begins and ends with a subsequence of length 2, and that these 2 subsequences of length 2 must be at least as frequent as the length 3 sequence. That is, if there are 23 occurrences of *abc*, then there must be at least 23 *ab* and at least 23 *bc*. Thus we can make another pass through the file, counting the frequency of subsequences of length 3, but limiting ourselves to those sequences which begin and end with subsequences of length 2 (which

are also frequent). Next we can make another pass for length 4 (limiting the sequences to those with frequent length 3 subsequences), another pass for length 5, and so on until we decide to stop. We can stop either when our last pass has produced no new sequences whose frequency-length product exceeds the previous set, or after a fixed number of passes.

Huffman Coding

All of the schemes for text compression discussed so far are similar in the sense that they confine themselves to working within the given character code and byte structure. Even more savings can result from recoding the character code representation itself. Almost all character code representations use a fixed code size: 6 bits for binary coded decimal (BCD), 7 bits for ASCII and 8 bits for EBCDIC. This can be very wasteful of space.

Consider the simple problem of encoding the 4 characters *A*, *B*, *C*, and *D*. If we use a fixed code size, then we could encode each character with 2 bits, as follows:

```
A 00
B 01
C 10
D 11
```

But suppose that the letter *A* occurs 50% of the time in the text, *B* occurs 25% and *C* and *D* split the remaining 25% equally. Then the following variable length character code will produce a shorter average text length.

```
A 0
B 10
C 110
D 111
```

To compute the average text length, consider that, out of *n* characters, *n/2* will be *A* which requires only 1 bit, *n/4* will be *B* for 2 bits each and the remaining *n/4* will be *C* or *D* for 3 bits each. Thus the total number of bits to represent *n* characters is:

$$1(n/2) + 2(n/4) + 3(n/4) = 1.75n$$

Comparing this with the *2n* bits needed for the fixed length code, we see that we have saved 12.5% of the total file size.

Variable length coding and decoding is somewhat more complex than fixed length coding, but not really difficult. It involves much more bit manipulation. To encode a string like *ABAABCDAB*, we simply concatenate the bit representations of each character, packing across byte boundaries as necessary.

```
A B A A B C D A B
0 10 0 0 10 110 111 0 10
```

To decode, we must scan from left to right, looking at each bit. For the string 01001100, we notice that the 1st bit is a 0. Only *A* starts with 0, so our 1st character is an *A*. The next bit is a 1, so it could be a *B*, *C* or *D*, but looking at the next bit we see that the next character must be a *B*. We remove the 2 bits for the *B*, and continue. The next bit is 0, so the next character is an *A*. The following bit is a 1, signifying either a *B*, *C*, or *D*. The next bit is a 1, signifying a *C* or *D*. Finally the next bit indicates a *C*. The last character is an *A*. So our decoded text is *ABACA*.

Computer stored text files can benefit greatly from Huffman coding. Huffman coding can be used anytime

IDS Announces S-100 Energy Management Module

The 100-EMM Energy Management Module provides temperature measurement at four separate locations indoors or out; monitors eight (8) doors, windows, or fire sensors; controls six external devices via relay or optoisolator; and provides an intrusion alarm with battery backup (alarm operates even during primary power outages). Put the 100-EMM to use in your home or business and claim a 30% tax credit for the cost of your S-100 computer system including the 100-EMM. (Purchasing the 100-EMM can actually save you several times its cost in tax credits. Full instructions for filing are included in the 100-EMM manual.)

**BUY THIS S-100 BOARD
AND GET A 30% TAX
CREDIT BASED ON THE
COST OF YOUR
COMPUTER SYSTEM!**

**100-EMM Energy Management Module
Assembled and Tested \$395.00
Kit \$345.00**

Options for 100-EMM:

CP-52 Cable Panel - Terminates two 26-conductor flat cables in 26 screwplugs. Use it for convenient interconnection of the 100-EMM to the "outside world". **\$45.00**

CABL-26-STD 26-Conductor Flat Ribbon Cable - Four feet in length with connectors for 100-EMM and CP-52 above. **\$35.00** Other lengths available on special order. Add **\$1.00** per foot.

OTHER PRODUCTS FROM IDS. The most complete source of S-100 compatible modules for process control, data acquisition, energy management, and data communications.

88-MODEM S-100 ORIGINATE/ANSWER MODEM WITH AUTO-DIALER. Software selectable baudrate provides any baudrate from 66-600 baud. Provides 1.5 stop bits when operated in 5-bit code mode. Auto-answer programs available for CROMEMCO CDOS, CP/M, North Star Horizon and MDS, and Alpha Micro.

Assembled and Tested \$395.00 Kit \$245.00

88-UFC UNIVERSAL FREQUENCY COUNTER

Four software selected inputs. Measure frequency from 0-650 MHz and period from .1µS to 1 Second. Extensive software included.

Assembled and Tested \$299.00 Kit \$199.00 Temperature-Compensated Crystal Oscillator option **\$145.00**

88-SAI SYNCHRONOUS/ASYNCHRONOUS INTERFACE

The most versatile serial interface on the market. Computer access/control of all data and handshake lines and provision for masked interrupts, inversion of any input or output signal, and onboard baudrate generation for 110, 134.5, 150, 300, 600, 1200, 2400, 4800, 9600, and many other baud rates. Many more features.

Assembled and Tested \$299.00 Kit \$199.00

88-SPM TIME OF DAY CLOCK with battery backup. Set the clock with three out instructions: no delays! Programs included in North Star BASIC, CBASIC, and 8080 assembly language.

Assembled and Tested with crystal option \$199.00 Kit less crystal option \$99.00 Crystal Option Kit **\$25.00**

88-RCB RELAY CONTROL BOARD

16 Relays on one board. Control appliances, production equipment, or even musical instruments (See BYTE Magazine Sept 1977 page 12)

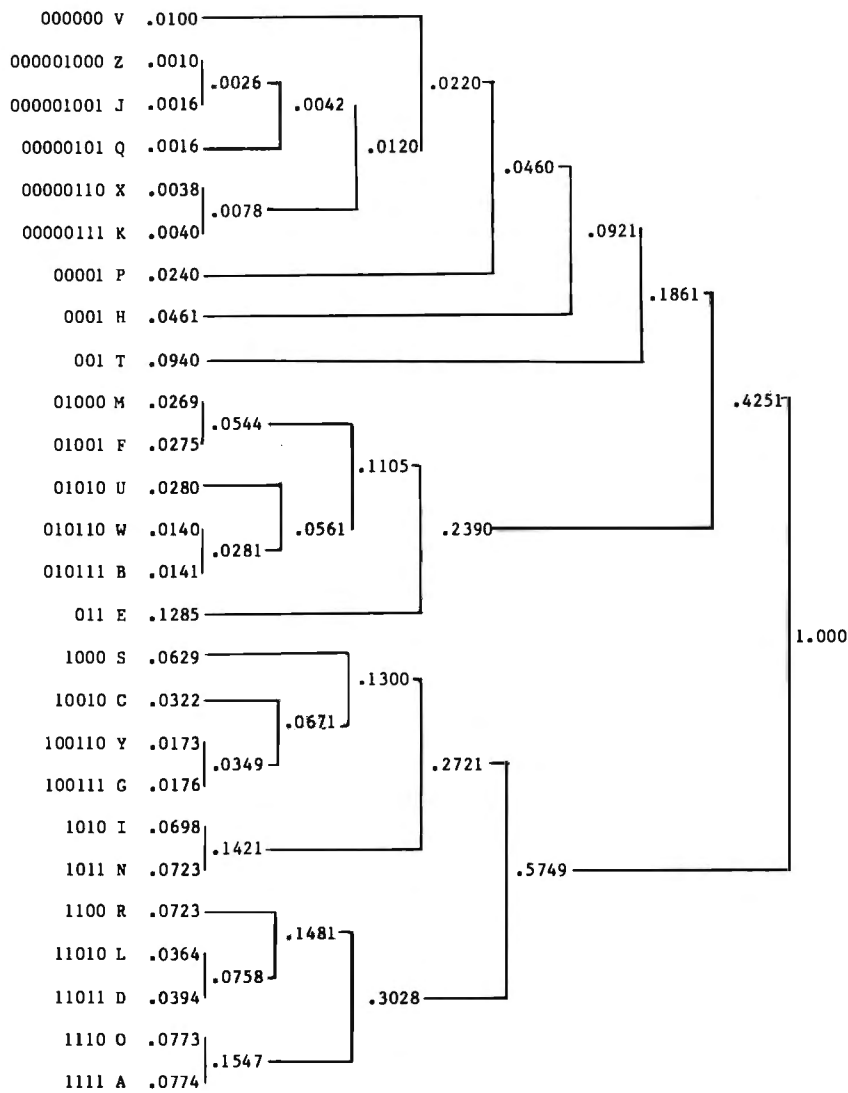

Figure 6: Huffman code for the letters of the English language, based on the probabilities (frequency of occurrence) of the letters in English. The code length is inversely proportional to the frequency of occurrence of a given letter (in much the same manner as Morse code). Code lengths vary from 9 bits (for z and j) to 3 bits (for e and t). The average length is 4.1885 bits per letter. Five bits would be necessary for a fixed length code, a space saving of 16 percent.

the probabilities of the character codes are not equal. In fact, the more unequal the probabilities, the better the compression with a Huffman coding. Looking at a table of frequencies of the letters in English, we can see that they are quite unequal, and hence can be compressed nicely with Huffman coding.

To construct a Huffman code, a very simple algorithm is used (refer to figure 6). First, it is necessary to compute the probabilities of the characters to be encoded. This requires 1 pass through some sample text, a part

of a file, the whole file or several files, as desired, counting the occurrences of different characters. Then we need to sort the characters according to their frequency. Take the 2 least frequently occurring characters, and combine them into a *super character* whose frequency is the sum of the 2 individual characters. The code for each of the 2 characters will be the code for the *super character* followed by a 0 for one character and 1 for the other. Now delete the 2 least frequently used characters from the list and insert the new *super character*

into the list at the appropriate place for its frequency. Continue this process until all characters and *super characters* are combined into 1 *super character*. The result is a Huffman code of minimal average code length. The Huffman code may best be seen as a binary tree with the terminal nodes (leaves) being the characters which are encoded.

Huffman coding can be quite successful in text compression, in extreme cases reducing the size of a file more than half. The basic technique can be improved upon in a number of ways. For example, pairs of characters, rather than single characters, can be used as the basis of encoding. This requires a much larger table of character frequencies, since now we need to compute the frequencies of character pairs, and larger tables of character pair and Huffman code associations, but can result in greater savings.

Another possibility is to use conditional Huffman coding. The objective here is to utilize the fact that the probability (frequency) of a character will vary depending upon what character precedes it. For example, compare the probability of a U following a Q (nearly 1) to the probability of a U following a U (nearly 0). So an optimal encoding should use a very short code for a U which follows a Q and can use a very long code for a U which follows a U. The encoding algorithm involves computing the frequency with which each character follows every other character. A separate Huffman code is then computed for the characters which follow each character. The encoding scheme remembers the last character encoded and uses that to select the code to be used for the next character. The decoding algorithm must also remember the last character decoded in order to be able to select the correct decoding algorithm.

Huffman codes are really quite simple, but they can be made more sophisticated to achieve increased text compression. However, even with simple Huffman codes, some problems can arise. First, notice that Huffman encoding and decoding both involve a great deal of bit manipulation, which can be very slow to program. Second, the best compression is achieved if a Huffman code can take advantage of the unequal fre-

Isn't it time you put some of your ideas in motion?

Well now you can. The Terak 8510/a was built to bring graphics to life.

This unique, completely self-contained, stand alone, desk top graphics computer gives you an animation capability that, until now, could only be obtained with a larger, more expensive system.

The nerve center, a powerful 16-bit microcomputer, allows effective animation, making it ideal for design, simulation, and modeling.

And an independently controlled 4K read/write memory allows the creation of an unlimited number of character sets.

This, coupled with the two ported main memory, allows the 8510/a to simultaneously display animated graphics and text. Until Terak, this capability could only be found in far more expensive systems.

What's more, Terak supports U.C.S.D., PASCAL, DEC RT-11, BASIC and FORTRAN IV software.

But the best part is the price. Only \$7,850. That's roughly half the cost of our nearest competitor's system—with roughly twice the competitor's capability.

So if you want to make the most of your ideas, put 'em in motion with a Terak

8510/a—the best priced performer on the market.

For more information, write Terak Corporation, 14405 North Scottsdale Road, Scottsdale, Arizona 85254. Or call (602) 991-1580.

terak

University of Utah
Computer Aided Instruction Group

quencies of characters in a file, but these will differ from file to file. Thus a separate encoding may be best for each file. This can be done by appending the code at the front of a file (as with the dictionaries used for abbreviations) but this increases the size of the file (significantly for small files).

Third, the variable length code nature of Huffman coding can make them extremely vulnerable to transmission or storage errors. In a fixed length code, if 1 bit is changed, only that 1 character is affected, while with Huffman codes, both that character and all succeeding characters may be decoded incorrectly because of a mistake in the assumed length of the incorrect character. (A similar problem would happen to a fixed length code if a bit were dropped or added.) Thus, for safety, it is necessary to add error detection and correction redundancy back into the file, increasing its size.

Still there are environments in which Huffman coding can be quite useful. Consider a word processing system storing files on a low speed serial device such as a cassette. Since

the system is special purpose, one can compute the expected frequencies of English characters and use 1 Huffman code for all files. Encoding and decoding would be done automatically by the tape driver routines. Alternatively the encoding and decoding could be built into the tape drive hardware itself as special purpose logic or a small processor with a read only memory encoding/decoding table. This encoding/decoding approach would be totally transparent to the user. The only effect on the user would be the ability to store a larger, but variable number of "characters" on a fixed amount of tape.

Conclusions

The amount of storage space needed to store information can be greatly reduced by simple text compression techniques like the ones we have presented here. Each of the techniques presented can save some space in many files. And many of the techniques can be used one after another to achieve more and more compression. Text compression can be a sim-

ple and effective method of increasing the amount of storage available in exchange for some processor cycles. ■

Analysis of Polynomial Functions with the TI-59 Calculator

Part 1

Pierre Chancé
20 Rue de Longchamp
75116 Paris FRANCE

Between the elementary functions accessible by direct calculation and higher-order equations reserved for the computer, there exists an intermediate domain where programmable calculators are useful.

Certain concrete problems sometimes lead to such equations without this creating an exceptional volume of calculation. Some have been encountered, for example, in the handling of small 6 by 6 matrices concerning medical data. Other technicians are also familiar with this type of obstacle in their fields. Consequently, the feeling is that it is worthwhile proposing a convenient program worked out on the Texas Instruments TI-59 and designed for sixth-order and lower-degree polynomial functions.

Independent of the advantages in mathematical terms, I hope that this article will give the user a meaningful introduction to this highly advanced calculator. For practical reasons, the original goals were as follows:

- calculate all the characteristic elements of the function (roots, maximums, minimums, and points of inflection where applicable)
- automatically plot the function curve
- control the program with a single key

Obtaining these conditions virtually eliminates any chance of operating error, and frees the user for other tasks once the calculation has begun. This is especially the case since the main program can be stored on a single magnetic card as can the printout program. Altogether, this provides a simplified procedure which nonetheless permits execution of the successive steps in the following

sequence:

- obtaining the appropriate boundaries of the interval to be studied
- choice of the increment
- recall of the maximum error
- calculation of roots in increasing order
- printout of correctly sampled tables of values

All of the above is applicable both for the initial polynomial and for derived polynomials. Because of the geometric significance of the derivative, these provide the maximums and minimums of the function as well as possible points of inflection.

Given that excessive automation can be inconvenient in certain cases, a manual procedure has been provided to permit using the keys to enter the lower and upper boundaries of the interval to be studied along with the value of the increment desired.

After a brief discussion of the calculation principles, the main program and then the automatic printout program for the function curve will be examined. A commentary on numerical applications will conclude the examination.

Calculation Principles

Here is the type of polynomial that will be dealt with:

$$P(x) = a_0x^n + a_1x^{n-1} + \dots + a_n \quad (a_0 \neq 0, n \leq 6)$$

where x is a real number and coefficients a_0, a_1, \dots, a_n , are known real numbers.

The method used to determine the roots of $P(x) = 0$ is

MODEL 800 • WITH SUNFLOWERS

A NEW MASTERPIECE IN PRINTERS

Sometimes the true value of a product fails to relate to its selling price. Van Gogh's paintings once sold for less than \$1,000. Base 2's MODEL 800 printer sells for lots less than \$1,000, but it does more than printers costing twice its price (and a lot more than a Van Gogh painting).

Besides being beautiful to look at, the MODEL 800 prints up to six different character fonts with embedded elongation in any of five line densities (72, 80, 96, 120 and 132 characters per line), prints up to three copies and is equipped with a long-life cartridge ribbon. With such versatility as four interface modes (IEEE 488, industry standard parallel, 20ma current loop and RS232), baud rates up to 19,200, and with accommodations for 115VAC or 230VAC operation, the MODEL 800 matches any system decor.

As a note of further new world refinement, the MODEL 800 can be optionally equipped with high speed paper advance and graphics output, a versatile tractor feed mechanism, terminal buffer memory, tabs and form feed.

Requiring only a square foot of space, the MODEL 800 is smaller than its contemporaries; its rugged aluminum construction is designed to stand the test of time.

Isn't it time you added a new masterpiece to your collection?

Recommended retail price:

Standard MODEL 800	\$499
High-speed paper advance	50
Tractor mechanism	50
Terminal buffer memory	50

Byte 12

bipartition. This consists of successive dichotomies of the interval (a, b) chosen with the function being continuous over this interval. The calculation is performed sequentially, and the step increment is designated by Δx .

To determine the root of the equation which belongs to the segment Δx , the latter is divided in two, and the calculator retains that half at whose extremes the function has opposite signs. The new shortened segment is further divided in two, and the process is repeated iteratively until the upper value of the residual interval is limited by the error limit. The middle of this final interval represents a root of the function to within the error.

This method provides only a single value in an interval Δx and requires more calculating time if boundaries a and b are taken too far apart. If they are taken too close together, the risk is obviously one of losing a root; the same applies if Δx is too large. Therefore we attempt to eliminate these drawbacks due to too much and too little by programming Lagrange's theorem. This replaces a subjective estimation of the boundaries by a calculation guaranteeing a reliable interval (a, b).

Let $a_0 > 0$ and a_k ($k \geq 1$) be the first of the negative coefficients of the polynomial $P(x)$. The following number as the upper limit of the positive roots of equation $P(x) = 0$ can then be used:

$$R = 1 + \sqrt[k]{\frac{B}{a_0}}$$

where B is the largest of the absolute values of the negative coefficients of the polynomial $P(x)$. Now the user no longer has to distinguish the two values of x between which the roots are supposed to fall. The calculator finds and prints them. To determine the possible limit of the negative roots of the equation, use $x = -z$. This involves changing the sign of the coefficients of the odd registers. However, if the latter equation has no positive roots, the initial equation has no negative roots and the calculator will not provide any.

Optimization of the process is completed by another method. As soon as a root is found, it serves as the lower boundary of the cycle of the following calculation. This sets the increment interval in the new segment to be explored. The correction is aimed at improving the reliability of root detection: this is an essential point.

Observe that details of the program code depend on some of the special capabilities of the TI-59 and PC-100A printing cradle. Naturally, the reader is referred to the instruction manual for full details. In passing, it is merely my intention to mention the decisive factors in my work.

The user has 960 program statements or 100 storage locations available with the possibility of adjusting their respective size as a function of the problem. Each memory block occupies eight program statements. The standard distribution adopted uses 480 program statements and sixty data-storage locations which will be filled entirely. The micromemory connects to the calculator and provides a library of twenty-five programs totalling 5000 steps.

Of the forty functions to which the OP key provides

DOUBLE DENSITY — A CAN OF WORMS?

DATASPEED believes it's time standing rumor to rest. Double density disk recording is alive and well and living in hundreds of DATASPEED disk controllers around the world. Many companies are advertising double density disk controllers — some have even delivered a few — but hundreds of delivered AND WORKING systems prove that DATASPEED is the front-runner in double density disk systems.

½ MEGABYTE OF DISK STORAGE — \$295 ASSEMBLED

The DATASPEED CONDUCTOR™ disk controller will put ½ megabyte of storage on any standard 8" disk — reliably. It also allows DOUBLE-SIDED recording for a fantastic 1 megabyte of storage on a single flexible diskette — reliably. We guarantee it.

THE CONDUCTOR can also offer the same guaranteed reliability for 5¼" diskettes in either single or double density and single or double sided modes. THE CONDUCTOR comes fully assembled and fully tested and can even be ordered with a customized, ready to go CP/M™ that performs disk accesses almost twice as fast as most other double density CP/M's.

DRIVE SYSTEMS — FROM \$1095

DATASPEED is also offering COMPLETE DISK systems. For instance, you can order a single drive system for just \$1095 that includes:

- 1 Shugart SA800 8" disk drive (½ megabyte)
- 1 DATASPEED CONDUCTOR disk controller
- 1 cable with connectors for 2 drives
- 1 attractive horizontal cabinet with space for 2 drives
- 1 2 drive power supply

The above system also includes everything you need to upgrade to a dual drive system at a later date — just plug in any standard 8" disk drive and you've got 1 megabyte of disk storage — or you can order a double drive system from us (as above but with 2 Shugart drives) for just \$1649.

REMINDER

SPECIAL OFFER EXPIRES
JANUARY 15TH

DRIVE SYSTEM — \$1095
WITH FREE SOFTWARE

OSBORNE ACCOUNTING SOFTWARE

For a limited time, DATASPEED will include with any drive system — FREE — the entire Osborne accounting software package (CBASIC-2™ Version) on double density diskettes. (Requires CBASIC-2 — available from DATASPEED for \$95 — manuals available separately). The software is available elsewhere in this publication for up to \$750!!!

(OFFER EXPIRES JAN. 15, 1980)

AVAILABLE NOW!!

DATASPEED is shipping controllers and drive systems off the shelf. Not in three months or six months — NOW!!! To order, see your local computer retailer — or order directly from us. (Because of the extraordinary prices, the complete drive systems are only available directly from DATASPEED). We accept checks, Master Charge and Visa.

ASK ABOUT OUR VIDEO CONTROLLER

Also, ask about the new DATASPEED memory-mapped video controller!! It features an 80x24 character format, user programmable character set, 128 bytes of user RAM, 1 or 2K of user ROM and HARDWARE SCROLLING!!

DATASPEED

access, special mention can be made of the following:

- printout of alphanumeric characters
- sign indicator
- error indicator
- incrementing and decrementing of memories
- listing of memory content
- listing of labels

Lastly, the T register is very important. Here, it is possible to store and recall a number and test it with respect to the contents of the display register.

In the final analysis, the TI-59 has the quantitative and qualitative features which prove useful in writing a program of the type that is being presented.

Main Program

Data entry:

For reasons of efficiency, the initialization sequence and data entry is not placed at the beginning of the program but at statement 066 with the LBL A instruction and statement 073 with the LBL B instruction (see listing 1). The coefficients of the polynomial are stored by conventional indirect addressing from x^6 at R_{16} to x^0 at R_{10} with a zero introduced when a corresponding term of a power of x is missing.

Evaluation of the polynomial:

This is the role of the LBL A' instruction placed at location 000 to save calculating time, since this sequence is called frequently.

Determination of boundaries and step increment:

The calculation is monitored by LBL C which, in particular, uses subroutines RCL and STO and PGM 08 of the Solid-State Software. After execution of the sequences the following results are given:

- the lower boundary a is printed out at location 091
- the upper boundary b is printed out at location 099
- the absolute value of the interval $(b-a)$ is printed out at location 117
- the step increment Δx is printed out at step 124 immediately after steps 120 thru 122 which contain the variable number of partitions of interval (a, b) or 020 in our listing

The appearance of a zero as a boundary value means the absence of roots for the interval considered, the coefficients of the polynomial being positive or zero. And by three successive calls (PGM 08 A, PGM 08 B, PGM 08 C) program C finally aligns the assignments with those of the library by storing a at R_{01} , b at R_{02} and Δx at R_{03} .

Program execution:

This discussion of the mathematical method used will save the trouble of describing the principles again. As for execution:

- LBL RCL (statement 133) changes the sign of the coefficients of the odd registers (R_{15} , R_{13} , R_{11})
- LBL STO (statement 155) plays a complex role. At statement 176, it stores the first coefficient which is

PRODIGY: YOUNG AND BRILLIANT

... "Though it may look like many other microcomputer systems . . . Prodigy One literally speeds away from them . . ." — Max Schindler, Software Editor-**ELECTRONIC DESIGN.**

Every so often an individual is born exhibiting extraordinary talent at a very early age. Often, they rise above the multitude establishing themselves as masters in their fields. These individuals are called prodigies.

The Prodigy computer is so advanced, it clearly establishes itself as a master in the field of small business computing.

Modular design and single board construction mean reliability, expandability, and ease of service.

But it is SOFTWARE which truly sets Prodigy apart. Unlike other computers, software was a major design consideration rather than an afterthought. Prodigy utilizes a highly advanced operating system and PROTEGE* to provide some very impressive features:

- | | |
|------------------------|-----------------|
| ■ DATA BASE MANAGEMENT | ■ INDEXED FILES |
| ■ VIRTUAL CODE | ■ SPOOLING |
| ■ DATA COMPRESSION | ■ MULTI-TASKING |

The result? Incredible speed and storage capacity, and economical systems development and maintenance.

Your local Prodigy dealer maintains an extensive library of field proven application software. Available applications include General Ledger, Accounts Receivable, Accounts Payable, Payroll, Medical Billing, and a remarkable system for the Personnel Placement Industry. All are easy to use yet provide a level of sophistication unheard of in its price class. And Prodigy also does word processing!

Prodigy systems are supported by a nationwide organization of thoroughly trained, experienced professionals. Your Prodigy dealer is a SINGLE source for hardware, software and a level of service that continually insures effective, trouble free operation.

Speed, sophistication, and low cost; an incredible combination for a small business computer. Would you expect less from a PRODIGY?

PRODIGY 
SYSTEMS, INC.

497 LINCOLN HIGHWAY • ISELIN, N.J. 08830 • (201) 283-2000

*Prodigy's easy to use compiler-based small business applications development language. Prodigy also supports other popular languages such as FORTRAN, COBOL, BASIC, and PASCAL.

not zero in register R_{07} and recalls its rank in R_{00} to store it at $STO\ 20$.

At statements 182 thru 192, all the terms of the polynomial, starting with the first, are divided by the first coefficient which is not zero. This makes a_0 positive and equal to 1. This operation must be kept in mind to correctly interpret the change from one polynomial to the next when reading the results.

Location of the first negative coefficient to determine its value and rank begins at statement 196 and uses two loops, statements 203 thru 205 and 207 thru 219. Finally, if the negative coefficient exists, its absolute value is stored in register R_{07} and its rank in register R_{02} , and then its relative position with respect to the first coefficient which is not zero is stored in register R_{20} . Incidentally, the register number of a coefficient (R_{01}) can be determined easily by adding 9 to its ordinal number (R_{00}).

The calculation of the negative coefficient which has the highest absolute value starts at statement 233 and uses the T register with a relatively sophisticated process. This employs four loops, 251 thru 242, 245 thru 267, 271 thru 249 and 279 thru 249. The evaluation of R in Lagrange's formula takes place at statements 255 thru 265.

On the whole, the STO program can be considered to end with the RTN instruction of statement 218 with a long conditional branch with multiple options which operates as a subroutine and ends at the RTN of statement 266.

Maximum error:

This factor is introduced by LBL D (statement 283) which is none other than the assignment of the error ϵ in R_{03} in accordance with the assignment of PGM 08 D in the library. From experience it can be seen that repetition of the error coefficient for each calculation sequence constitutes a constraint, and that setting it at 0.01 in the absence of error entry, as provided by PGM 08, does not really spare the user from this preoccupation.

The fact is that although the precision required varies from one operator to the next, everyone generally uses a rather constant factor for a series of calculations.

It is thus practical to keep ϵ in the program, even if this means modifying it to the programming mode as soon as the need arises. This is the role of LBL D' (statement 399) where statements 400 thru 410 can contain ϵ up to 1×10^{-10} unless less precision is preferred. It is then sufficient to fill the empty spaces with NOP instructions or simply with zeros after the first significant figure. Since LBL D' calls D at statement 411 but is itself called by C at

MAGSAM™

KEYED FILE MANAGEMENT SYSTEM

Sophisticated applications made simple.

Put data at your fingertips...easily accessed, displayed, and updated by key. MAGSAM™ allows your CBASIC programs to create and access sophisticated keyed file structures through simple CBASIC statements.

Powerful, affordable, and easy to use.

MAGSAM™ is now available in three versions offering an array of features and capabilities. Standard MAGSAM™ features include random by key, sequential by key, generic by key, randomly by record number, and physical sequential access techniques. Each MAGSAM™ Package includes the MAGSAM™ file manager, tutorial program, file dump utility, User Guide, Reference Card, and one year update service.

- **MAGSAM™** — Most advanced version. Secondary Indexing with any number of keys, and Record and Key Deletion with automatic reuse of freed space. \$145†
- **MAGSAM II™** — Single Key support with full Record and Key Delete capability. \$99†
- **MAGSAM I™** — Entry level version. Single Key support without Delete functions. \$75†
- **MAGSAM™ User Guide only** — comprehensive tutorial and reference manual. \$15

Available for 8" soft sector, Micropolis, and TRS-80 disk formats. Requires CP/M™ or derivative and CBASIC. Distributed as CBASIC subroutines in source form.

Visa and Mastercard welcome. Dealer and OEM inquiries invited.

HOLIDAY SALE ON TELETYPE

Good until December 31

TELETYPE MODEL 43

- 4320 AAA (TTL interface) \$945
- 4320 AAK (RS232 interface) \$1,085
with transformer to operate on 50Hz, 220v, installed
inside cabinet add \$75
We stock paper and ribbon for the Teletype Model 43

**PET, NEC SPINWRITER, DIABLO, CENTRONICS,
TRS-80, PER SCI also available.**

- HAZELTINE 1500 (assembled only) \$945**
- 1510 \$1,085
- with 50Hz, 220v current adaptation \$100
- also available with Danish, German or French
character sets add \$30

INTERTUBE II \$800

IMS 5000 SERIES, COMPLETE Z80 SYSTEM
2 I/O ports, 1 K EPROM bootstrap loader, double
density, dual 5 1/4" disks, CP/M. S-100, 12 slot main-
frame. A new rising star! No waiting.

MARINCHIP SYSTEMS M9900

ELEGANT 16 BIT CPU, S-100 COMPATIBLE
Multi-user, multi-processor operating system. PASCAL,
Extended precision commercial BASIC, FORTH, META &
applications package. Complete kit and DISCEX soft-
ware \$550; Assembled \$700. We configure systems to
meet your budget & your needs. Hard Disk interface (with
software) available.

IMS MEMORY, 16K Fully static, 250 ns \$285

TEI S-100 Mainframes

- 12 slot — MCS 112 \$433
 - 22 slot — MCS 122 \$609
- These mainframes are completely assembled, tested
and contain everything required for plug-in operation.

TARBELL Floppy Disk Controller \$255
Other Tarbell products available.

UPGRADE DECWRITER II

For 1200 Baud operation.
Microprocessor-based Controller from Datasouth . . \$750

INNOVEX—the most reliable 8" floppy drive on the
market! MTBF greater than 8,500 hours. Head life greater
than 15,000 hours under normal operating conditions.
Shugart compatible.
Drive alone \$ 522
2 drives with power supply and cabinet \$1,565

SIEMENS DRIVES

8" Double Density, Shugart Compatible \$420

MODEM: "THE CAT" from Novation \$190
Originate/Answer. 300 baud.

TO ORDER: We ship within 24 hours after receipt of certified check, money order or cash-
iers check. Credit cards: add 4%. Personal checks: allow ten days. \$12 shipping for ter-
minals. \$3 for memories and modem. New York residents include sales tax. Prices and
availability subject to change without notice.

statement 129, it is clear that key C finally controls recall, printout and then entry of the maximum error ϵ programmed by the operator.

Calculation of roots:

The heart of this calculation is PGM 08 E from the library which we call at statements 292 and 309. Determination of the successive roots is implemented by our LBL E (statement 291). From the second root, the lower boundary a takes the value of the preceding root augmented by a minimum quantity equal to $\epsilon \times 10$. This augmentation is an artifice designed to move the calculator off the solution it has just found.

The process continues up to unsuccessful exploration of the last interval. At printout this initiates the characteristic series of 9.999...? provided by the manufacturer's PGM 08. LBL E itself is controlled by LBL C at statement 130. This is why key C in fact initiates determination of the roots at the right time.

Tables of values of ϵ and $P(\epsilon)$:

These two tables are successively printed out by LBL C' (statement 323) which samples thirty-nine suitable stored values of x from registers R_{21} thru R_{59} and replaces them immediately in the same registers with the thirty-nine corresponding values of $P(x)$. The median of x may be very close to zero. This means that the median of $P(x)$ corresponds to the value of the polynomial for $x = 0$ when $P(x) = P(-x)$.

The sequence C' starts with restoration of the lower boundary a in R_{01} and stores a new increment in R_{03} taken from forty statements between a and b . An automatic listing of the memories with loop and error-indicator control provides indexing of the values.

Sequence C' is itself controlled by LBL E at statement 320 after FLAG 07 has used the error signal from the end of root determination. Given that LBL E is subordinate to LBL C, as was stated earlier, sequence C' is finally implemented by key C also. Given the partition used, the thirty-nine sample values of x and then of $P(x)$ occupy statements 480 thru 959. Those of $P(x)$ can be recorded on a magnetic card in groups 3 and 4 for automatic printout by points of the function curve. The polynomials derived from $P(x)$ could obviously be recorded in the same manner.

Calculation of derived polynomials:

The derivation of each polynomial term of the general expression ax^n gives a term of the expression anx^{n-1} . The calculation is performed by LBL B' (statement 414) which, by depressing key B' once, prints out all the coefficients from x^n to x^0 . The sequence has been designed to provide $P'(x)$ from $P(x)$, $P''(x)$ from $P'(x)$ and so forth as long as the polynomial remains differentiable. Since the program then divides the polynomial by its first nonzero coefficient, it will come as no surprise to find a derivative divided by this term. This in no way changes the final results.

As soon as key B' has played its role, it is sufficient to depress key C for the derived polynomial to be handled in accordance with the same complete cycle as described for the initial polynomial. No other intervention is necessary, unless it is desired to return to the initial

We want you to
always have
a perfect
record.

Ours.

Maxell has the best quality control record in the industry. So we're certain to always give you the best Floppy Disks in the world.

Some reasons why Maxell is so good.

Every Maxell Floppy Disk is guaranteed to be perfect. We tolerate no ifs, ands, buts, excuses, or dropouts. It's that simple . . . and that tough.

In fact we have developed innovative manufacturing techniques that actually slow down certain processes, sacrificing speed to gain quality. And our unique binder system, developed by our own engineers, applies the magnetic oxide with amazing uniformity and surface smoothness.

Ten out of ten: a perfect record.

Of course, Maxell Floppy Disks conform to ISO and IBM specifications. They also have been recommended by major OEMs, because Maxell works best with their hardware.

So open a box, and know in advance that it holds ten perfect floppies. You're right to not settle for anything less. Neither do we.

Maxell offers the full range of Floppy Disks, from standard 8-inch to 5¼ -inch, plus Data Cassettes. *Dealer inquiries invited.*

maxell.

polynomial to evaluate it as a function of the roots found for the derived polynomials. This determination is only made after all the derived polynomials that are deemed useful have been used in sequence by the automatic procedure just indicated.

When the coefficients of the initial polynomial have been reentered from R_{16} to R_{10} as at the beginning, enter each root on the keyboard, and each time depress A' . This evaluates the corresponding $P(x)$. The function curve is then completed by virtue of the geometric significance of the derivative by the following coordinates:

- to the root of $P'(x) = 0$ taken as the abscissa corresponds an ordinate by $P(x)$ which defines a maximum or minimum of $P(x) = 0$
- to the root of $P''(x) = 0$ taken as the abscissa corresponds an ordinate by $P(x)$ which defines a point of inflection of $P(x) = 0$ if there is one

Program of Function Curve

Principle:

The curve of the polynomial is automatically plotted as shown in the program in listing 2. It was necessary to conceive an algorithm that compensates for the relative weakness of the TI-59 in this area, since it accepts only twenty whole positive values on a 2.5 inch tape.

With the exception of special cases, the spacing of the plotted points is manifestly insufficient. It can be seen that to cover an 8.5 by 14 inch sheet of paper (a standard European A4 sheet, 21 by 29.7 cm), six strips of machine

Listing 2: Listing of the program that will plot the function curve.

Retro-Graphics™

For your Dumb Terminal. The Retro-Graphics PC card mounts easily in the Lear Siegler ADM-3A to provide you with an affordable graphics computer terminal.

Features:

- Z-80 Based
- 512 by 250 Dot Matrix
- Simple Plug-in Interconnect
- Point Plotting
- Automatic Vector Generation
- Optional TEKTRONIX Software Compatibility

You will be impressed with the packaging, performance and price of the Retro-Graphics card. Write or phone today for complete specifications.

TELEX NUMBER 951021, NEECO

paper must be juxtaposed. In practice, this means making the data positive, preparing a suitable format and then dividing it into six parts. Thus, the calculator can sequentially print the asterisks corresponding to the thirty-nine values of registers R_{21} thru R_{59} . This can be accomplished in six runs.

Since asterisks will be printed for only thirty-nine pieces of data on 39 by 6 runs, a printout arrangement by points on the base line is used to mark the nonoperation. The interval between points is equal to the increment of the table of the values of x .

Location in the plane is completed by two other arrangements:

- a sign in the shape of a triangle, in place of a point, marks the middle of the base line when there is no value on the zero abscissa
- the ordinates are marked laterally by a column of points with twenty per tape

Initialization and data entry:

These operations are performed by LBL A (statement 047) and LBL B (statement 053). The lower data item entered first is stored in register R_{07} , and the upper data item, entered second, is stored in register R_{08} . The choice of these values determines the amplitude of the graphic reproduction. If it is desired to cover a maximum field, it is necessary to determine the extremes of the values to be reproduced by concurrently consulting the table of the values of $P(x)$ and the group of values of $P(x)$ for x taken from the roots of $P'(x) = 0$.

Note that LBL B continues (statement 057) with the ad-

dition of the tenth of each value entered. This automatically provides a margin for the sheet.

Service labels:

Since there is no point in spreading signs on a page without identification, a certain number of sequences permit projections along the abscissa and ordinates. LBL ADV (statement 001) prints one point on the base line of the strip when no data appears on the corresponding abscissa. You will recognize the alphanumeric code controlled by instructions OP 00, OP 01 and OP 05.

Instead of a point, LBL PRT (statement 201) prints a small triangle in the middle of the base line. This distinctive sign marks the zero abscissa when no data item corresponds to it. This median is recognized by monitoring register R_{40} in passing and, by subtracting its ordinal number, it checks for the zero condition using the T register ($= t$ or $\neq t$). The conditional transfer is executed by means of the LBL = instruction at statement 220 and LBL PGM at statement 243 (the first being called as a subroutine at statement 043 by the LBL - instruction and the second at statement 232 by the LBL = instruction). Naturally, the T register is restored to its previous value immediately after statement 234 and before returning to the main program to serve in the test of the upper limit for the following data item.

Incidentally, it can be observed here that the user is dealing with a structure with four levels of subroutines (main program - SBR - - SBR = - SBR PGM - SBR PRT). The calculator can handle them with no difficulty, since it can accept up to six successive calls. The ordinate location is provided by LBL E' (statement 250), called at

statement 181, which prints a column of points at the end of the tape. For reasons of economy, the alphanumeric characters are grouped in LBL D' at statement 269 and recalled as a subroutine whenever needed.

Data printout:

LBL LOG (statement 020) prints an asterisk when the value of R_{00} recalled by indirect addressing is between the lower and upper limits of the tape considered. Printout uses a special instruction OP 07. Conditional transfer is provided by LBL — which transfers execution to LBL LOG if the data item is acceptable after subtracting the value of the lower limit stored in register R_{20} . Finally, the data item processed is excluded from the printing field by addition of the group of seven instructions of the tape format contained in register R_{06} (statements 029 thru 035).

Data conversion:

This operation is executed by LBL D (statement 072). It assigns the thirty-nine data items collected by recording in groups 3 and 4 of registers R_{21} thru R_{59} on completion of calculation of the initial $P(x)$ polynomial. However, this could just as well be a polynomial derived for another calculation purpose. The positive value and formatting of this data for printout are obtained with a better spread by dividing them by the increment of the table of values of x contained in register R_{03} . Each converted data item replaces the previous data item term for term in the same register R_{21} thru R_{59} .

Tape printout:

Printout of the six tapes is controlled by LBL E (statement 127). This sequence begins with calculation of the tape format stored in register R_{06} . Tape indexing depends on register R_{01} , initially loaded with zero at statement 146, then incremented at statement 166 and printed at statement 173. The lower tape limit is calculated at statement 165 (STO 20) and the upper limit at statement 177 for loading in the T register.

Transfer to the test of the upper tape limit is executed by instruction SBR — at statement 181. The mechanism of LBL E uses a double loop:

- 149 thru 198 for register R_{09} for data counting loaded at 39
- 179 thru 185 for register R_{05} for tape counting loaded at 6

The entire system is actuated by simply depressing key C, since LBL C at statement 067 monitors D and E. Part 2 of this article will discuss the numerical applications of this program. Samples will be provided to illustrate the initialization and plotting procedures to be followed to output the function curve. ■

Glossary

Lagrange's method: Several theorems exist that can solve for the real root(s) of a polynomial equation by means of successive approximations. Lagrange's method obtains the real root using only integer calculations, thereby eliminating any roundoff error. This process is therefore very useful for separation of roots located in a small interval.

New for the APPLE II & TRS-80*

the subLOGIC FS1 Flight Simulator!

Experience the excitement of a new era in computer simulation as you make your landing approach after a practice flight in your FS1. Then return to the skies where enemy fighters are waiting to intercept you.

The FS1 is a visual flight simulator that gives you realistically stable aircraft control. And its beautifully accurate graphics are produced by a high-performance driver capable of drawing 150 lines per second.

Please DO NOT confuse the FS1 with other software claiming to offer flight simulation. The FS1's sophistication, speed, and beauty are way beyond the ordinary.

See the FS1 package demonstrated at your dealer's, or order directly from subLOGIC. Either way, it's only \$25 plus 75¢ for UPS or \$1.50 for first class mail. VISA and MasterCard accepted.

*16K required. Specify your system: Apple II or TRS-80 Level I or Level II.

Minimizing Curve-Plotting Calculation

Timothy G Bowker
Systems Research Laboratories Inc
2800 Indian Ripple Rd
Dayton OH 45440

Are you plotting the results of time-consuming calculations? The efficient routine described here will give you accurate curves with fewer calculated points.

This article is written for the most common type of plotter/software combinations which draw straight lines between calculated points. Figure 1 shows superimposed curves, both of which are plots of the function 2^x as an example. The smooth curve is produced using a very small ΔX , while the other is created with a ΔX equal to 2. The marks below the X axis indicate the values of X (and ΔX , between two marks) used for the non-smooth curve. A comparison of the two curves illustrates where the greatest error occurs. When ΔX is constant and large, and straight lines are drawn between calculated points, the accuracy of a plot is less in regions of sharper curvature. The accuracy decreases in regions of greater slope (given equal curvature and constant ΔX) because the plotted line-segment length is greater at steeper slopes.

It is often desirable to have consistent accuracy throughout a plot, and yet minimize the number of points required to plot a curve (to minimize calculation and running time). In such a case, it would be more efficient to use small values of ΔX in regions of steep slope and/or sharp curvature, and large values of ΔX in regions of little slope and little curvature.

Ideally, ΔX could be adjusted so that with a minimum number of calculated points, a curve would be plotted (with discrete, straight-line segments) such that the curve appeared accurate. This result may be achieved as illustrated in figure 2. (Again, the ΔX values used are marked below the X axis.) Note the smaller number of points calculated in the low slope/low curvature ($X < 0$) area of the curve. Compare this with figure 3 which was plotted with a constant ΔX of 0.1. Figure 2 has slightly better resolution at the steepest part of the curve ($\Delta X_{\min} \cong 0.09$) as well as having been plotted with less than half the points required for figure 3.

Figure 4 sheds additional light on the technique. The plot is identical to figure 2 except that crosses have been marked at each plotted point. Note that line-segment lengths are similar at both ends of the plot (where curvature is slight) but that the value of ΔX on both ends is

Figure 1: True curve superimposed on curve plotted with $\Delta X=2$. Notice less accuracy in regions of greater slope or curvature using constant ΔX .

vastly different, as may be observed by the X_i markers below the X axis. Also note that where curvature is greater, ΔX is adjusted to yield shorter line-segment lengths (as around $X = 2$).

Figure 5 is a duplicate of figure 3, with crosses added at plotted points, which further emphasizes the effort wasted in low slope/low curvature areas using a constant ΔX .

The Method

ΔX may be automatically varied during the running of a plotting program by estimating the curvature and slope

Let your LSI-11* break the 28K barrier

With our Bank-Switching family

In LOCAL mode our memory is functionally just like DEC memory. But when you run out of memory space you're not lost. Add an inexpensive Bank-Switch Controller (BSC-256) and you can go to **two megabytes**. Add another and go to **four megabytes**.

So don't get boxed in with other brands of LSI-11* memory. Break free. Join the family:

RMA-032	32K by 16 bit RAM. On-board refresh	\$1200 (Single qty.)
RMS-016	16K by 16 bit ROM. (Intel 2716)	\$300 (Single qty.)
BSC-256	The Bank-Switch Controller	\$300 (Single qty.)

Substantial quantity discounts are available. For a free copy of our Bank-Switching manual, call or write on your company letterhead.

of the upcoming curve. This is based on the slope of the last two plotted points and the curvature of the last three plotted points.

When there is no curvature, the plot segment length must still be limited, due to the look-back nature of the ΔX determination routine. In other words, the routine cannot assume that the rest of the plot is straight simply because the last portion was perfectly straight. Therefore, when dealing with a curve with no curvature, no matter what the slope, this routine will plot a line segment of approximately constant length. This length is selected by the programmer to accommodate the nature of the curve being plotted and resolution requirements.

This routine may be conveniently implemented using slope, trigonometric functions, angles, and changes in angle. A strictly geometric approach, while possibly appearing better than a trigonometric one, has serious difficulties.

The present routine stores the last two values of both X and Y and finds the appropriate "plot" slope of the last plotted curve segment. (It is necessary to be concerned with the slope as it appears plotted. The mathematical slope $(Y_i - Y_{i-1}) / (X_i - X_{i-1})$ will probably not equal the plot slope due to difference between the X and Y scales. If 1 inch on the Y axis covers a ΔY of M and 1 inch on the X axis covers a ΔX of N, then the mathematical slope, $\Delta Y / \Delta X$, should be multiplied by N/M to yield the plot slope. M and N should be fairly accurate for proper program operation.)

The arctangent of the last plot slope is computed to yield the last plot angle. Taking the cosine of the last plot angle and multiplying by the value of the desired line-segment length (using X axis units) yields the required ΔX estimate for the next point as illustrated in figure 6. That is, when the last two line segments' curvature is zero:

$$\Delta X_i = X_{i+1} - X_i = L \cos \left\{ \arctan \left[\frac{N(Y_i - Y_{i-1})}{M(X_i - X_{i-1})} \right] \right\} \quad (1)$$

where:

L = desired maximum line-segment length,
N/M = scale difference adjustment factor.

This determines the contribution to ΔX from the plot slope (or first derivative) effects.

Notes on Figure 6

Assume (X_4, Y_4) and (X_5, Y_5) have been plotted, and ΔX_4 and Q_4 (the corresponding slope angle) have been calculated, but that ΔX_5 , X_6 , Y_6 , and Q_5 are not yet known. It is assumed that Q_5 will be approximately equal to Q_4 , which is generally true for small line-segment

GET FREE GAMES!

...When you subscribe to SPI magazines

Subscribe to *Strategy & Tactics* The Magazine of Conflict Simulation

Now in its second decade of continuous publication, *S&T* is the prime magazine of strategy gaming and military history. Every issue comes complete with a full fledged simulation game — diecut cardboard playing pieces, 22" x 32" map, and rules of play bound in the magazine. Plus fascinating historical articles, reviews, and game related material. All the great battles of history are yours to fight again in the games of *Strategy & Tactics Magazine*.

YOURS FREE
When you subscribe to *S&T* you'll get *Chickamauga*, a terrific Civil War contest, normally selling for \$4.

Subscribe to *Ares* The Magazine of SF and Fantasy Gaming

The first issue of this unique science fiction/fantasy magazine will appear February 1980. Each magazine will contain a brand-new ready to play sf or fantasy game PLUS stories, illustrations, reviews, articles on game strategy, as well as science-fact material. *Ares* will be the blending of speculative fiction and gaming, bringing new excitement to both interests. Be a subscriber and get your free bonus game!

YOURS FREE
When you subscribe to *Ares* you'll get *The Creature That Ate Sheboygan*, a tongue-monsters threatening a typical American city. A \$4 value — FREE!

Subscribe to *MOVES* The Magazine of Gaming Technique

A necessary companion to *S&T* and *Ares*, *MOVES* carries analysis of play by experienced gamers, 'nuts and bolts' articles on game design and tough talking critiques of SPI games and those of other publishers.

YOURS FREE
When you subscribe to *MOVES* you'll get *Arnhem* the exciting re-creation of the Allied air-drop on Nazi occupied Holland. A \$4 game — FREE!

Figure 6: Illustration of the trigonometric estimation of next ΔX , with no consideration of curvature. The line segment lengths have been exaggerated for demonstration purposes. The plot was run with the listed program with $L=2$ and $C=0$.

lengths. Without considering curvature, you want H_5 to equal L , the desired line-segment length. From figure 6:

$$\frac{\Delta X_5}{H_5} = \cos Q_5$$

Assume $Q_4 \approx Q_5$ so:

$$\frac{\Delta X_5}{H_5} \approx \cos Q_4$$

Substituting L for the desired value for H_5 :

$$\frac{\Delta X_5}{L} = \cos Q_4$$

$$\Delta X_5 = L \cos Q_4$$

which is the estimate used for ΔX_5 to yield a line-segment length approximately equal to L , without consideration of curvature.

To adjust ΔX for curvature (or second derivative) effects, the plot angle of the last plotted curve segment is subtracted from the plot angle of the previously plotted curve segment to yield the change in plot angle. This value yields a direct indication of curvature, which is not, however, equal to the second derivative.

Since you are not concerned with the sign of the curvature, only its magnitude, take the absolute value of the change in plot angle. (You were not concerned with the sign of the slope either, but since this program is designed only for plots of single valued functions of "X" ($\Delta X > 0$), the cosine of the plot angle will always be positive, regardless of the sign of the slope, thus eliminating the need to take the absolute value.)

Taking equation 1 for ΔX without curvature and setting the plot angle equal to Q , you have:

$$\Delta X = L \cos Q \quad (2)$$

for ΔX without curvature.

Perhaps the simplest way to include a contribution from the change in plot angle is in the following form:

$$\Delta X = \frac{L \cos Q}{1 + C(P-Q)} \quad (3)$$

where C is a weighting factor which controls the effect of the change in plot angle (curvature) on ΔX , and P is the plot angle previous to the last plot angle, Q . Thus, $P-Q$ = the change in plot angle. It may be seen that equation 3 reduces to equation 2 when there is no curvature ($P = Q$, $P-Q = 0$). The weighting factor C is perhaps best determined by experimentation, but will probably be approximately equal to L when P and Q are in degrees.

Program Initialization and Operation

Since the program in listing 1 utilizes a look-back algorithm, some initialization is required because there are no "previous three points" at the beginning of the program.

More than meets the eye.

The new Series 5000 is mighty for its size. In more than several thousand ways!

In fact, it's the first small system offering over a megabyte of integrated mini-floppy capacity. And with its super memory management, you can have better than 300k of RAM in desk or desktop versions. But hardware is just the tail of the whale...

It's the wide selection of software that really makes this system mighty.

Operating systems? Choose CP/M* with CBASIC†—the most widely accepted small computer operating system ever. Or MVT-FAMOS,** a multi-user, multi-tasking operating system with file management like the big guys. Or MICROCOBOL,††

also for multiple users, but implemented in COBOL, familiar to commercial users the world over.

And application programs for these operating systems number in the thousands. From real estate to accounting, taxes to inventory control, they're all available at low cost—ready to run.

When you add these software and hardware features to Industrial Micro Systems' reputation for rugged, reliable quality products you'll begin to see it all. A lot more system than your first glance reveals.

See even more at your dealer. Call us to find out the name of your nearest dealer. He'll tell you everything you need to know. And really open your eyes!

Table 1: List of variable definitions that are used in the plotting routine that outputs the curve in figure 2.

Therefore, at the start of the program, an arbitrary small value (0.01 in the example) is assigned to ΔX (D in the program). I is initialized to zero and X is set to $X_{min} - D$.

When the program first starts, X is incremented by D to yield X_{min} . Y is then calculated, the point (X_1, Y_1) is plotted, and I is incremented by 1 to total the number of points that have been determined.

Since two points are needed to have a slope, I is tested to see if two or more points have been determined yet. If not, the program skips to line 15 where the first calculated Y value is stored in Z. In line 16, the first X value is stored in W. Then the program returns to line 5 where X is incremented by the initial value of D, to yield the second value of X.

Next, the second value of Y is calculated, the point (X_2, Y_2) is plotted, and 1 is added to I. Since two points have now been determined ($I = 2$), the test in line 10 causes the program to continue to line 11, where the first slope and first slope angle are determined.

Since three points (two plotted line segments) are needed to determine a change in slope, the test in line 12 senses that only two points have been determined, and jumps to line 14 where the first plot angle is stored in P.

Listing 1: Essence of program listing that will run on a Hewlett-Packard 9825A desktop computer and plot a function on the Hewlett-Packard 9872A plotter. The program is written in Hewlett-Packard's HPL language. The parameters in this particular listing will plot the curve in figure 2.

X_2 and Y_2 are then stored in W and Z, respectively, and the program again returns to line 5 where X_3 is computed. Then Y_3 is calculated, (X_3, Y_3) is plotted, I is incremented to a value of three, and in line 11 the plot angle from points (X_2, Y_2) and (X_3, Y_3) is computed.

Since there are three points plotted (two line segments and two plot angles), the value of change in plot angle may be calculated. The test in line 12 allows the program to continue to line 13 where the change in plot angle ($|P-Q|$) is computed as part of the ΔX calculation equation.

The program returns to line 5 where, for the first time, X is incremented by a calculated ΔX , rather than the initialized value of ΔX .

The program continues in this way until Y_i is found to exceed Y_{max} in line 9, and then the program stops. ■

AGENS™

LOW COST ASSEMBLY GENERATION SYSTEM

You can assemble machine language programs for any of the popular 8 and 16 bit microcomputers.

You can use this meta-assembler to generate procedures and structures that best fit your applications.

This system is hosted on your Z-80 computer using CP/M and 24K or more bytes of memory.

The Works. Iterative passes for forward ref optimization, subscripts, remote names, macros, functions, externals, relocation classes and more.

BONUS: Source link loader file so you can customize your system.

\$170: AGENS on 8" diskette, Loader, sample generators and manual.

\$27: Manual only.

THERE IS A DIFFERENCE IN TRS-80 DISK DRIVES CAPACITY

Expansion interface – gives your TRS-80 the disk capacity it needs, and much, much more!

10 to 40 MByte, 8" Winchester drive – expands capacity far beyond Model II storage.

Single sided minifloppy – up to 150 KBytes of storage capacity.

Single or double sided 8" floppies – up to 2.5 MBytes in dual drive cabinet – for the serious TRS-80 user.

LOBO DRIVES' new family of disk memory products provides you with a choice of memory capacities you need to effectively execute the complex business software you've developed for your TRS-80*. LOBO DRIVES' selection of readily available, software compatible drives permits you to expand your inventory, payroll, customer list, and accounts receivable files as your business grows.

And LOBO DRIVES brings you more... a new plug-in expansion interface that provides an easy way to add hardware enhancements, communications capability, and programmable features... and it comes with the LOBO DRIVES famous 1 year, 100% parts/labor warranty.

Call or write for the complete LOBO DRIVES story. Find out just how competitively priced a family of high capacity drives can be...

Noniterative Digital Solution of Linear Transfer Functions

Bryan Finlay
Chief of Biomedical Engineering
University Hospital
POB 5339, Postal Stn A
London Ontario
CANADA N6A 5A5

Introduction

This article will develop a technique for the precise, noniterative, digital solution of the time-domain response of linear transfer functions with constant coefficients. A computer program written in BASIC is provided for use on the Hewlett-Packard 9830A desktop computer. The program is suitable for solving equations that, in the Laplace domain, exhibit up to ten roots in either the numerator or denominator.

This program is shown to be at least ten times faster than certain iterative solutions when used for checking analog simulation data.

A complex second-order transfer function is used to demonstrate the use of the program in evaluating responses to impulse, step, ramp, and sinusoidal forcing functions.

Due to the availability of desktop computers it is thought that this relatively simple program could help to enhance educational courses in automatic control theory, as well as being of interest to personal computer users.

Most digital solutions of differential equations with constant coefficients involve iterative procedures. The efficient use of such procedures requires the operator to have a good knowledge of both the solution to the equations and the iterative procedure. A "feeling" for the time-course of the solution is particularly important when the response is oscillatory, otherwise an iterative solution can become quite inaccurate.

In the design and development of a complex automatic control system it is a common practice to use an analog computer simulation. The accuracy of the initial simulation is generally checked by comparing the analog results with those obtained from a digital solution of the equations. If the differential equations can be considered to have constant coefficients, then a noniterative solution of

the time-domain response can be obtained by digital techniques.

Many automatic control theory problems present themselves in the form of the system transfer function and subsequent rearrangement to define the differential equations for iterative solution (as required by the Hewlett-Packard State Variables Pac). This can be a tedious, if not dissuading, process. It is the intention of this article to develop a technique that will permit the

32K Board Pictured Above

New RAM Prices.

From The Dynamic Memory Company.

16K—\$249 32K—\$375
48K—\$500 64K—\$625

Ever since we started making these memory boards over a year ago we have continued to lower our prices to stay competitive. Due to your confidence in us, we are again able to lower our prices! Our reliability has been proven by months of superior performance in thousands of installations. Our low-power boards are being used by quality-minded systems manufacturers across the country and overseas.

4MHz boards now available.

After receiving hundreds of requests, our engineering staff has come up with a new version of our board which runs on 4MHz Z-80 systems. It wasn't easy to come up with a high speed board which would operate as reliably as our 450ns version, but after months of careful design and testing, we did it. The price of the 250ns board is \$10 per 16K additional.

All of our features remain.

Our boards didn't become great sellers only because of the price. We still offer you our deselect feature which allows our RAM to overlap with any fixed memory areas in your system. Also, the RAM area of our board is fully socketed so that you can expand the board yourself.

Other standard features include: plug selectable addressing on 16K boundaries (shorting plugs are placed over wire-wrap pins to address the board — located on the top of the board for easy changes), S-100 and Z-80 compatibility and totally invisible refresh — no wait states.

Fully assembled, tested, and guaranteed.

All of our boards go through a rigorous testing procedure. They are then placed on burn-in running a series of memory tests to detect any other possible faults. After you receive the board, you are backed by us with a one year warrantee.

Low power consumption keeps your computer from "losing its cool."

The total power consumption of our 16K board is typically less than 4 watts (+8V @ 300ma, +16V @ 150ma and -16V @ 20ma). Boards with additional memory typically increase power consumption only 1 watt per 16K!

Standard S-100 Interface.

Our board is designed to interface with any standard S-100 CPU. All of the timing of the board is independent of the processor chip, and the board is set up for different processors by changing two plugs on the board.

Contact your local dealer.

To find out more about our RAM boards, contact your local dealer. If he is unable to help you, call or write us for a fast response. Central Data Corporation, 1207 North Hagan Street, Champaign, IL 61820. (217) 359-8010

Central Data

digital solution of the time-domain response of linear transfer functions (or more generally Laplace transforms) by a noniterative process.

Analyzing the Response of Dynamic Systems

In order to emphasize the power of using transfer functions to analyze the response of dynamic systems, an example is given here to cover both the derivation and use of the transfer function. Consider a relatively massless object being moved by a spring and damper (dashpot) as shown in figure 1; this type of arrangement could characterize a door closing mechanism. An idealized spring exerts a force, f_s , that is directly proportional to the compression or extension, x , applied to it:

$$f_s = k x$$

An idealized damper exhibits Newtonian viscosity such that the force, f_d , that it exerts is directly proportional to the rate of compression or extension:

$$f_d = k_1 \frac{dx}{dt}$$

The constants of proportionality in these cases are k and k_1 and have units of N/m (lb/ft) and N per m/sec (lb per ft/sec) respectively.

Figure 2 shows the three forces acting on the mass and so permits us to apply Newton's second law of motion which tells us that "the summation of forces in a given direction is equal to the product of mass and acceleration that will take place in that direction."

$$f(t) - kx - k_1 \frac{dx}{dt} = M \frac{d^2x}{dt^2}$$

If the mass-acceleration term is small in relation to the other forces then this equation can be estimated as follows:

$$k_1 \frac{dx}{dt} + kx = f(t)$$

In the simplest case this equation can be solved by separation of variables and integration. However, the problem is compounded by the fact that the applied force $f(t)$ may be a time-dependent quantity itself. A few examples of such time-dependent functions are: impulse, step, ramp, or sine wave functions.

Virtually all automatic control systems contain elements that, in mathematical terms, require the use of differential equations. Consequently, aerospace, industrial, process-control and biological investigators have latched on to a convenient and consistent technique for solving these equations. The technique is summarized in the block diagram below:

Figure 2: Free-body diagram illustrating the total forces and the resultant mass-acceleration acting on the mass M of figure 1.

Using standard tables each element in the differential equation is transformed to its Laplace transform. The transformed equation is rearranged to form the transfer function which is defined as the Laplace transform of the output divided by the Laplace transform of the input. In the example, if we consider the force $f(t)$ to be the input quantity and the displacement x to be the output then the transfer function is:

$$T(s) = \frac{X(s)}{F(s)} = \frac{1}{k_1 s + k} = \frac{1/k}{1 + \frac{k_1 s}{k}}$$

where $X(s)$ and $F(s)$ are the Laplace transforms of x and $f(t)$ respectively. The transfer function is a simple version of the Laplace transform since it assumes that all initial conditions are zero. This assumption effectively says that it does not matter whether the spring moves from 50 cm to 100 cm or moves from 150 cm to 200 cm; the resultant movement is 50 cm and the assumption of ideal springs means that the changes in forces will be the same. Note that it is the changes in forces from a steady state that will determine the dynamic behavior.

In the absence of a computer, the normal procedure to follow from this stage would be to choose an input quantity $f(t)$ and substitute its Laplace transform, $F(s)$, into the transfer function. The transfer function could then be manipulated algebraically by separating it into partial fractions to produce standard forms that may be found in a table of Laplace transforms. This set of standard equations in the Laplace domain could then be retransformed back to the time domain. For those seeking a more complete approach with detailed examples the Thaler and Brown textbook will provide good reading. The major

Say "ADI/OS"

TM - COMPCO

to your data acquisition and display problems with COMPCO'S Analog - Digital I/O System.

The complete ADI/OS system includes everything required for a research and development laboratory, and many OEM systems: 16 channels of single-ended analog input (or 8 differential channels); two double-buffered D/A channels for driving a X-Y display (display not included); 32 bits of programmable digital I/O; 4 completely independent RS232 serial ports with software-selectable Baud rates; a Microterm MIME-I CRT terminal; a Houston Instruments HIPLØT incremental plotter; and an ALTOS 8000-2 microcomputer system, with 4MHz Z80* processor, 64K of RAM memory, twin Shugart double-density floppy disk drives, CP/M¹ operating system, and Microsoft FORTRAN. COMPCO's GSP interactive graphics package is included to provide graphics output on the CRT terminal, HIPLØT plotter, and/or a X-Y display. A FORTRAN-callable subroutine package is also provided to perform the analog data acquisition. In addition, two unused serial ports may be used to drive a modem (permitting the system to talk to a larger machine), an additional CRT terminal for color graphics, or a serial line printer such as a TI-810 or NEC Spinwriter. *Z80 is a trademark of Zilog † TM - Digital Research

This entire ADI/OS system is available from COMPCO for **\$9,995**

COMPUTER SPECIALISTS

Figure 3: Time-domain response of system in figure 1 when subjected to a step change in the force $f(t)$.

portion of this article provides a computer approach to the solution of the differential equations by means of the transfer function.

If the input, $f(t)$, is a step change in force of unit value then the resulting value for $x(t)$ is given by:

$$x(t) = \frac{1}{k} (1 - e^{-t/\tau})$$

where τ is a characteristic of the system and is defined as the time constant; in fact it is the ratio k_1/k . The displacement x will be 63.2% complete after a time $t = \tau$ and will be 98% complete when $t = 4\tau$. Consequently, the facility to read a time constant from a transfer function is valuable in describing the time-domain response of a system. A typical displacement response to a step change in force for a system with a one second time constant and stiffness k of unit magnitude is shown in figure 3.

High fidelity enthusiasts will know that the performance of a system is not clearly conveyed by its response to a step change in input. The frequency response provides a more informative set of data and concerns the response of a system to the input of a sine wave. Any linear system when subjected to a sine wave input will produce a sine wave of the same frequency at its output. However, the output sine wave will have an amplitude that is dependent upon the applied frequency. The peak of the output wave may also occur at a different time to that of the applied input. This phase shift, as it is called, is also frequency dependent.

A good high fidelity system will have a constant plot of amplitude versus frequency over its desired operating range, usually around 50 Hz to 20 kHz. In practice a voltage variation of 30% is considered to be good and

would be expressed in logarithmic terms as a 3 dB variation.

The transfer function is an extremely powerful tool in the plotting of frequency response data since it can be shown mathematically that the substitution of $j\omega$ for s in the transfer function gives the amplitude and phase for a given frequency ω radians per second (note $\omega = 2\pi f$), after initial transients have decayed.

The operator j is used to indicate a vector at 90° . A vector a would lie on the x-axis of a graph and go from zero to a . The vector ja goes from zero to a on the y-axis of a graph. A vector jja would mean that the vector a had been rotated through 90° and 90° again, or 180° . This means that j^2a , as a vector, has the same meaning as $-a$. Consequently, the operator j can be looked upon mathematically as $\sqrt{-1}$ (note $j^2 = -1$).

Applying this knowledge to the transfer function for the spring and damper system yields:

$$T(j\omega) = \frac{1/k}{1 + j\omega\tau}$$

The denominator of this equation is a vector with a real part (x-axis) of unity and complex part (y-axis) of $\omega\tau$. For small values of ω this vector has a value of 1 and lies along the x-axis, indicating it has a phase of 0° . At very high frequencies the vector will have a magnitude of $\omega\tau$ and lie along the y-axis, indicating a 90° phase shift.

If we consider a system with a time constant of one second and unit stiffness of k then the resulting graphs of amplitude and phase versus frequency are shown in figures 4 and 5. When the amplitude versus frequency data are plotted on this log-log scale, the response is seen to approximate a horizontal low-frequency asymptote

The Comprint 912

No one else can match our speed, our price, our quality, our quiet operation, or our reliability. Not for \$660 they can't.

Our Comprint 912 is the best printer for the money. Period. Any printer that can match our price can't even begin to match our performance. And any printer that boasts performance like ours doesn't even come close to our price. No matter what your application; computer reports, listings, CRT hard copy, message

The Comprint 912 prints nearly 3 lines every second.

Speed.
At 225 characters per second (170 LPM) the Comprint 912 is up to 4 times faster

than impact printers costing hundreds of dollars more. With our printer you don't waste time and money waiting for your print-out.

Print Quality.

Our 9x12 matrix provides sharp, crisp characters. Compare that with our competition. Their very best is a 9x7 matrix, which means no lower case descenders and cramped letters. With the Comprint 912 you don't have to put up with the irritation of fuzzy, hard to read computer printing. This

receiving, scientific/ industrial data logging, or anything you can think of, the Comprint 912 is the performance leader in printers under \$1000.

First consider our performance.

CRT hardcopy is an excellent application for the Comprint 912.

exceptional print quality in
ly by the Comprint 912 in 7
nless reliability, 6 month

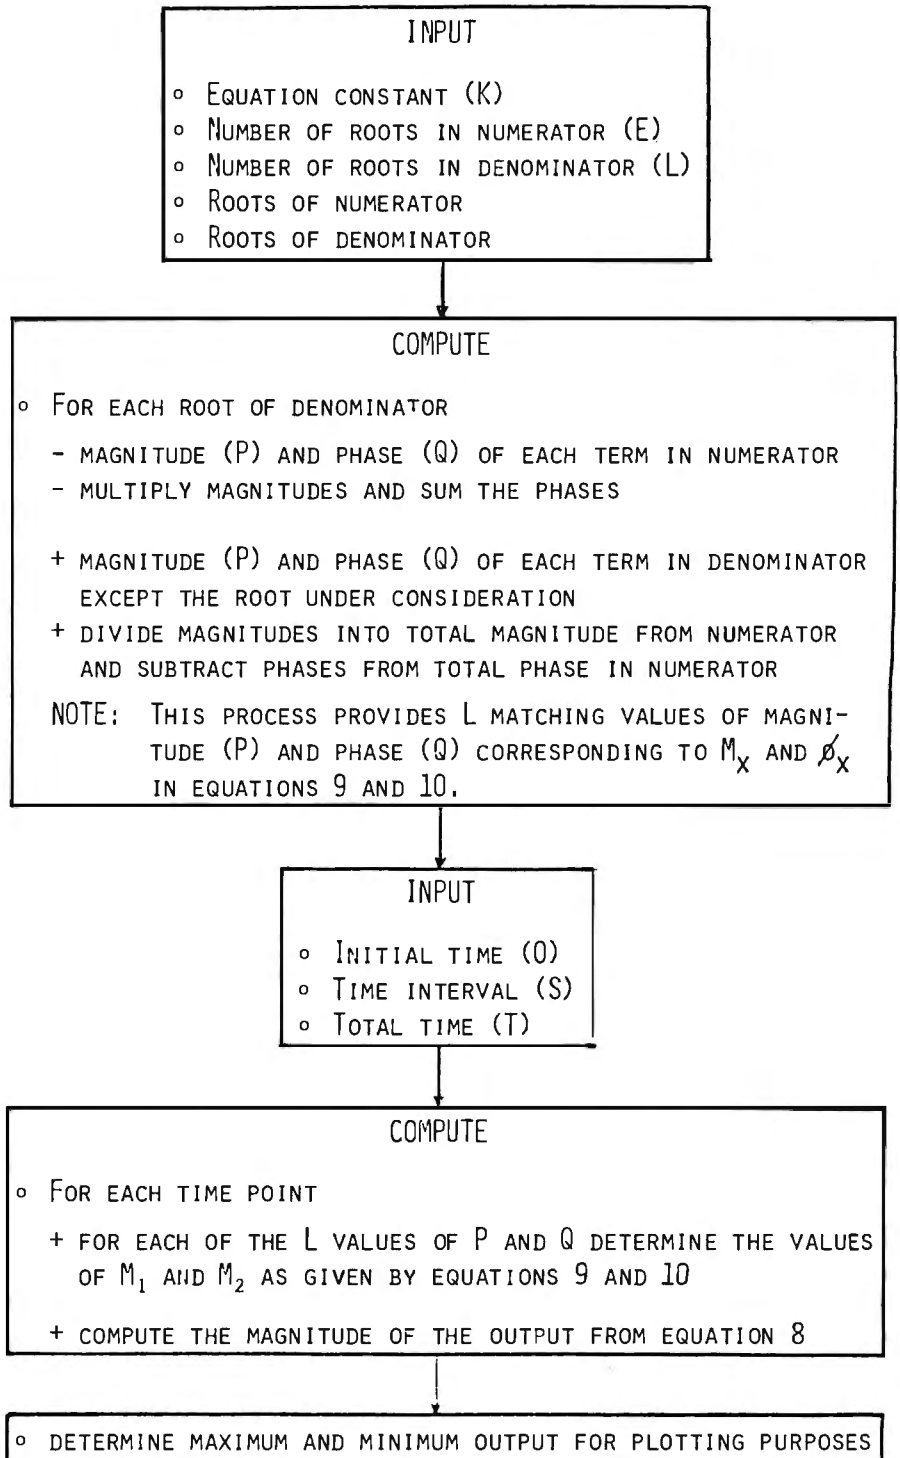

Figure 6: Flow diagram and guide to the computer program which is provided in listing 1.

Figure 7: Noniteratively computed unit impulse response of a complex second order lag with unity gain, damping factor (ξ) of 0.1, and natural angular frequency of 5 radians per second. Computing/plotting interval is 0.04. The equal real parts of the system transfer function have been made to differ by an amount 0.0001 (1 part in 5000).

Text continued from page 148:

and a high-frequency asymptote with a slope of -20 dB/decade. The frequency at the point of intersection of these two asymptotes is 0.159 Hz in this example and, in general, is known as the break frequency and is given by:

$$\omega = \frac{1}{\tau} \quad \text{or} \quad f = \frac{1}{2\pi\tau}$$

It is at this frequency that the actual frequency response curve is 3 dB below the break point.

This simple example illustrates the use of transfer functions and helps to relate the response of a system in both the time domain and the frequency domain. The transfer function, therefore, provides a ready starting point for obtaining either time-domain or frequency-domain solutions. Since the substitution of $j\omega$ for s in the transfer function permits easy computation of the frequency response, it would be nice if a computer program was readily available to obtain plots of the time-domain response from the transfer function. It is the intent of this article to develop and illustrate the use of such a program.

General Solution of Laplace Transforms

Given a general Laplace transform $F(s)$ which is the ratio of two polynomials:

$$F(s) = \frac{P(s)}{Q(s)}$$

with the order of $Q(s)$ equal to, or greater than, the order of $P(s)$, then an inverse Laplace transform, may be

evaluated to define the time-domain solution.

Inversion to the time domain may be accomplished by applying a partial fraction expansion and thus expanding $F(s)$ to a sum of simpler expressions each of which may be found in tables of Laplace transforms (refer to W D Day's Tables of Laplace Transforms). This system is illustrated below for a relatively simple transform:

$$F(s) = \frac{4}{(s+2)(s+3)} = \frac{A_1}{(s+2)} + \frac{A_2}{(s+3)} \quad (1)$$

$$\text{Giving } F(s) = \frac{4}{(s+2)} - \frac{4}{(s+3)} \quad (2)$$

In equation 2, the value of A_1 has been derived by multiplying both sides of equation 1 by $(s+2)$ and letting $s = -2$. Similarly, A_2 was obtained by multiplying by $(s+3)$ and setting $s = -3$. More precisely:

$$A_1 = \left. F(s) \times (s+2) \right|_{s=-2}$$

and,

$$A_2 = \left. F(s) \times (s+3) \right|_{s=-3}$$

for a general transform with n different non-complex roots in the denominator, then:

$$A_x = \left. F(s) \times (s+r_x) \right|_{s=-r_x} \quad (3)$$

where r_x is the x th root.

The time-domain solution of equation 1 is:

$$f(t) = A_1 e^{-2t} + A_2 e^{-3t}$$

or more generally:

$$f(t) = A_1 e^{-r_1 t} + A_2 e^{-r_2 t} + \dots + A_n e^{-r_n t} \quad (4)$$

for a transform with n different non-complex roots in the denominator.

Combining equations 3 and 4, the general time-domain solution for a transform with n different non-complex roots is given by:

$$F(t) = \sum_{s=-r_1}^{-r_n} \left. (s+r_x) \times F(s) \times e^{st} \right|_{s=-r_x} \quad (5)$$

where x is assigned each value from 1 to n . This form of solution is generally referred to as the Residue Theorem solution (refer to the Thaler and Brown text for details). Equation 5 clearly lends itself to digital programming. However, when equal or repeated roots exist in the

OUR GOAL ... To provide a complete 'Solution System' to the Dealer, OEM, or anybody with a job which requires a powerful computer.

IN SHORT ... To deliver a system which is ready to be used.

How do we do this? Very simply ... We don't stop with just a powerful set of hardware. Instead we've integrated an intelligent package of systems level software, including:

PDOS — A Z80, CP/M (Ver 1.4) compatible Disk Operating System, Designed to equip you with large system power. Not a floppy DOS modified to accommodate hard disks!

Back-Up — A comprehensive data recovery system.

... And of course the entire CP/M library of programming languages & applications programs.

Our System 1000 is available **NOW**, with second sources on all components. This means we can deliver systems today and continue to support them tomorrow.

Write for more details on our —
'End to Obsolescence Plan'.

Available Options:

Floppy disk sub-systems
CP/M Ver. 2.00

NOTE: Our Back-Up system is available in special versions for CP/M & CDOS, for those who already have S-100 Hard Disks Systems.

CP/M is a TM of Digital Research

PDOS is a product of Phoenix Software
Associates Ltd.

CDOS is a TM of Cromemco

Solution by Residue Theorem

Digital programming of the differentiation of equation 6 is not the simplest process and, in practice, is unnecessary. Due to the number crunching capacity of small-scale desktop digital computers, the problem of two equal roots can be surmounted quite readily. When inputting the data on the roots, one of the two equal roots is changed by a relatively small amount (approximately 0.1 or 1%). While electronic control systems may employ components with tolerances causing a 1% error in the roots, experience tells us that the difference in the plotted curves will be virtually indistinguishable in any practical system.

The problem of repeated roots has effectively been

solved, and it is necessary only to develop equation 5 to a form capable of handling complex roots.

If r_x is complex (of the form: $-a - jb$), then equation 5 tells us that the root r_x makes a contribution, $f_1(t)$, to the total response in the time domain at time t where:

$$f_1(t) = \left| (s+a+jb) \times F(s) \times e^{st} \right|_{s = -a-jb}$$

giving: $f_1(t) = M_x e^{j\phi} e^{-[a+jb]t}$

or rearranging: $f_1(t) = M_x e^{-at} e^{j[\phi-bt]}$ (7)

The real (Re) and imaginary (Im) parts of $f_1(t)$ are respectively:

$$f_1(t) \text{ (Re)} = M_x e^{-at} \cos(\phi-bt)$$

$$f_1(t) \text{ (Im)} = M_x e^{-at} \sin(\phi-bt)$$

The total system response, M , at a specific time t is given by:

$$M = \sqrt{M_1^2 + M_2^2} \quad (8)$$

Where $M_1 = \sum_{x=1}^n M_x e^{-r_x t} \cos(\phi_x - b_x t)$ (9)

and $M_2 = \sum_{x=1}^n M_x e^{-r_x t} \sin(\phi_x - b_x t)$ (10)

Bit Pad One™ is the small, low-cost digitizer that lets you add a graphics or menu capability to any data processing system. It's perfect for data entry, CRT cursor control, games, mapping and countless business applications like order entry and inventory control.

Bit Pad One is small in size, but big in reliable capability.

The 11" x 11" active area has a resolution of 0.005" which is comparable to digitizers found in expensive turnkey graphic design systems.

Best of all, Bit Pad One is designed and built by Summagraphics, the leading manufacturer and OEM supplier of data tablets and digitizers.

Bit Pad One. It's bringing digitizing down to earth.

DYNACOMP

Quality software for: Altair
North Star
TRS-80 (Level II)

Sophisticated software written by recognized computer professionals. Each program is supplied with complete documentation. All programs can be run with standard terminals (32 characters or wider) and within 12K program memory space.*

FLIGHT SIMULATOR

(as described in SIMULATION, Volume II)

- Realistic and extensive three-dimensional simulation of take-off, flight and landing.
- Based on aerodynamic equations and real airfoil.
- Practice instrument approaches and navigation using radials and compass headings.

Price: \$17.95
SIMULATION, Volume II (BYTE Publications): \$6.00

VALDEZ*

- (Requires 16K of program memory)
 - Exciting simulation of supertanker navigation in Prince William Sound and Valdez Narrows using radar map.
 - Detailed physical model of ship response and tidal patterns.
 - Chart course through ship and iceberg traffic.
- Price \$14.95

BRIDGE 2.0

- Complete contract and duplicate bridge game.
 - Computer both **bids and plays**.
 - Computer will play offense or defense according to the bid.
 - Challenging entertainment for the advance player.
 - Excellent learning tool for the bridge novice.
- Price: \$17.95

HEARTS 1.5

- An entertaining computer simulation of this popular card game.
 - Play against two computer opponents.
 - Beware the Black Maria!
- Price: \$14.95

NORTH STAR TEXT EDITOR

- (Update of program described in BYTE, June 1979)
 - Designed as an easy-to-use (and remember) basic text editor.
 - Works through unmodified North Star DOS.
 - Line-oriented editing, variable line width, simple paragraph indexing.
- Price: \$10.95 (Available only on North Star diskette)

NORTH STAR COMPRESSION PROGRAM

- Removes all unnecessary spaces and remark statements from program.
 - Requires only a single disk drive.
 - Any size program may be processed.
 - Increases execution speed of programs while using less memory.
- Price: \$9.95 (Available only on North Star diskette. Requires release 4 or higher North Star BASIC.)

Except where noted, all software is available on North Star diskettes, and Altair and TRS-80 cassettes.

Additionally, Microsoft BASIC ASCII listings are available on paper tape and cassette (modem compatible, 300 baud).

All orders processed within 48 hours. Write for more detailed descriptions of these and other programs available from **DYNACOMP**.

Computer Program

The BASIC program developed for solving these equations is shown in listing 1. $F(s)$ is assumed to have a maximum tenth-order numerator and/or denominator of the general form:

$$F(s) = \frac{K(s+A1+jB1)(s+A2+jB2)\dots(s+A10+jB10)}{(s+C1+jD1)(s+C2+jD2)\dots(s+C10+jD10)}$$

Obviously, any complex root must have a conjugate for the equation to have any meaning.

The flow diagram for the solution of the equations is given in figure 6. The program permits 201 output data points to be evaluated, or 200 time divisions. Full four-word accuracy is employed in the intermediate computations and, to save memory, two-word accuracy is employed in the stored values of the output.

In practice, three types of output have been found useful:

- A tabular printout of time and magnitude.
- A thermal printer plot of output versus time provides crude but rapid viewing of the unknown response and so permits optimizing the time interval and total time to achieve the most informative plot.
- A digital, pen-plotted output for formal presentation.

Use of link statements on the HP9830A allowed this program to be run with 2 K words of memory. However, a 4 K word memory permitted simultaneous loading of all program files onto the key files.

Results and Discussion

Consider the complex second-order transfer function with unity gain, damping factor (ζ) of 0.1, and natural angular frequency of 5 radians per second:

$$\frac{V_o(s)}{V_i(s)} = \frac{25}{s^2 + s + 25} \quad (11)$$

For a unit impulse, $v_i(t)$, then $V_i(s) = 1$ and:

$$V_o(s) = F(s) = \frac{25}{(s+0.5+j4.975)(s+0.5-j4.975)}$$

Since the computer interprets the real parts of these roots as being equal, it is necessary to change one of them by a small amount (approximately 0.5001 in this case).

The impulse response of equation 11 is shown in figure 7. This curve was computed for 201 points from $t=0$ to 8 at 0.04 intervals.

Frequently, a digital computer solution is required as a check on the accuracy of an analog computer simulation. The efficiency of this computer program in providing such data is illustrated in table 1. The test is to compute the output at 0.5-second intervals for the first 5 seconds of figure 7. The performance of the program was compared with a standard iterative procedure employed by the Hewlett-Packard Math Pac volume 1.

a PERCOM SAMPLER

For your SS-50 bus computer — the CIS-30+

- Interface to data terminal and two cassette recorders with a unit only 1/10 the size of SWTP's AC-30.
- Select 30, 60, or 120 bytes per second cassette interfacing, 300, 600 or 1200 baud data terminal interfacing.
- Optional mod kits make CIS-30+ work with any microcomputer. (For MITS 680b, ask for Tech Memo TM-CIS-30+—09.)
- KC-Standard/Bi-Phase-M (double frequency) cassette data encoding. Dependable self-clocking operation.
- Ordinary functions may be accomplished with 6800 Mikbug™ monitor.
- Prices: Kit, \$79.95; Assembled, \$99.95.

Prices include a comprehensive instruction manual. Also available: Test Cassette, Remote Control Kit (for program control of recorders), IC Socket Kit, MITS 680b mod documentation, Universal Adaptor Kit (converts CIS-30+ for use with any computer).

MIKBUG® Motorola, Inc.

In the Product Development Queue . . .

Coming PDQ. Watch for announcements.

6809 Processor Card — With this SS-50 bus PC board, you'll be able to upgrade with the microprocessor that Motorola designers describe as the "best 8-bit machine so far made by humans."

The Electric Crayon™ — This color graphics system includes its own μ P and interfaces to virtually any microcomputer with a parallel I/O port.

Printer Interface — For your TRS-80™. Interface any serial RS232 printer to your TRS-80™ with this system.

™ELECTRIC WINDOW, ELECTRIC CRAYON, Pilon-30 and Pilon-10 are trademarks of Percom Data Company, Inc.
TRS-80 is a trademark of Tandy Corporation and Radio Shack which has no relationship to Percom Data Company.

Orders may be paid by check or money order, or charged to Visa or Master Charge credit account. Texas residents must add 5% sales tax.

For your data storage — Pilon-30™ and Pilon-10™ data cassettes

- Orders-of-magnitude improvement in data integrity over ordinary audio cassettes.
- Pilon-coated pressure pad eliminates lint-producing felt pad of standard audio cassettes.
- Smooth pilon coating minimizes erratic tape motion.
- Foam pad spring is energy absorbing. Superior to leaf spring mounted pad which tends to oscillate and cause flutter.
- Five-screw case design virtually precludes deformation during assembly.
- Price: \$2.49.

For your S-100 computer—the CI-812

- Both cassette and data terminal interfacing on one S-100 bus PC board.
- Interfaces two recorders. Record and playback circuits are independent.
- Select 30, 60, 120, or 240 bytes per second cassette interfacing, 110 to 9600 baud data terminal interfacing.
- KC-Standard/Bi-Phase-M (double frequency) encoded cassette data. Dependable self-clocking operation.
- Optional firmware (2708 EPROM) Operating System available.
- Prices: kit, \$99.95; assembled, \$129.95.

Prices include a comprehensive instruction manual. In addition to the EPROM Operating System, a Test Cassette, Remote Control Kit (for program control of recorders), and an IC Socket Kit are also available.

CASSETTE SOFTWARE

For 8080/Z-80 μ Cs . . .

BASIC ETC — Developed by the co-authors of the original Tiny BASIC, BASIC ETC is easy to use yet includes commands and functions required for powerful business and scientific programs as well as for hobby applications. 9.5K bytes of RAM. 1200-baud cassette and 42-page user's manual . . . \$35.00

Cassette Operating System — EPROM (2708) COS for the Percom CI-812 dual peripheral interfacing PC card . . \$39.95

If you're programming on a 6800 μ C, you'll want these development and debugging programs written by Ed Smith of the Software Works:

Disassembler/Source Generator — Disassembles SWTP Resident Assembler, TSC Mnemonic Assembler/Text Editor or Smoke Signal Mnemonic Assembler/Text Editor and produces compacted source code suitable for re-editing. Prints or displays full assembly-type output listing. 4K bytes of RAM. (Order M68SG) . . . \$25.00

Disassembler/Trace — Use to examine (or examine and execute) any area of RAM or ROM. "Software-single-step" through any program, change the contents of CPU or memory location at any time, trace subroutines to any depth. 2.3K bytes of RAM. (Order M68DT) . . . \$20.00

EPROM Support/Relocator Program — This program relocates a program in any contiguous area of RAM or ROM to anywhere in RAM. Use to assemble and test programs in RAM, adjust programs for EPROM operating addresses and then block move to your EPROM burner address. 952 bytes of RAM. Loads at hex 1000. (Order M68EP) . . . \$20.00

Relocating Assembler & Linking Loader (M68AS) . . . \$50.00

Relocating Disassembler & Segmented Source Text Generator (M68RS) \$35.00

Americana Plus — 14 tunes for the Newtech Model 68 Music Board in machine language ready to load and run. Cassette compatible with Percom CIS-30+ and SWTP AC-30. Order MC-1SW . . \$15.95

HARDWARE

Newtech Model 68 Music Board — Produces melodies, rhythms, sound effects, morse code, etc. from your programs. Includes manual with BASIC for writing music scores and assembly language routine to play them. Installs in SWTP I/O slot. Assembled & tested . . . \$59.95

The Percom ELECTRIC WINDOW™ — Memory-resident and programmable, this video display character generator board for your SS-50 bus displays up to 24 80-character lines. Features dual character generators, dual-intensity high-lighting. One programmable register controls scrolling. Compatible with standard video monitors . . . \$249.95

SS-50 Prototype Cards:
Large card (up to 70 40-pin ICs) \$24.95
I/O size card . . . \$14.95

Table 1: A measure of the efficiency of the computer program in verifying the accuracy of an analog computer simulation.

TIME (seconds)	RESIDUE THEOREM	OUTPUT			
		ITERATIVE SOLUTION			
		Integration Time (seconds)			
		0.5	0.1	0.01	0.005
0	0.000	0.000	0.000	0.000	0.001
0.5	2.381	9.375	2.054	2.378	2.380
1.0	-2.943	-43.36	-2.757	-2.940	-2.943
1.5	2.194	117.8	2.433	2.195	2.194
2.0	-0.9269	-161.9	-1.564	-0.9322	-0.9281
2.5	-0.1850	-290.8	0.5962	-0.1778	-0.1834
3.0	0.7909	2775	0.1653	0.7850	0.7895
3.5	-0.8654	-10265	-0.5901	-0.8630	-0.8648
4.0	0.5901	22981	0.6902	0.5914	0.5903
4.5	-0.2045	-15666	-0.5620	-0.2083	-0.2053
5.0	-0.1051	-130420	0.3283	-0.1010	-0.1042
Total Time for Computation and Printout (seconds)	25	10	25	200	390

It is clear from table 1 that the cumulative errors for an iterative process with integration time, δt , of 0.1 produced inadequate results at $t=5$. Accuracies of 4% and 1% are obtained at $t=5$, for integration times of 0.01 and 0.005 seconds respectively. However, the total computing times of 200 and 390 seconds respectively are drastically larger than the 25 seconds associated with the Residue Theorem approach. By employing fast memory in the HP 9830A the total computing and printout time can be reduced to 15 seconds. Use of the Infotek FP 30,

fast processor, can reduce this total time even further to approximately 8 seconds.

A unit step input (ie: $V_i(s) = s^{-1}$) in equation 11 gives $F(s)$ as:

$$F(s) = \frac{25}{(s+0+j0)(s+0.5001+j4.975)(s+0.5-j4.975)} \quad (12)$$

A unit ramp input (ie: $V_i(s) = s^{-2}$) in equation 11 gives $F(s)$ as:

$$F(s) = \frac{25}{(s+0+j0)(s+1 \times 10^{-8}+j0)(s+0.5001+j4.975)(s+0.5-j4.975)} \quad (13)$$

Figure 10: Computed initial transients of the transfer function used in figure 7, when it is subjected to a unit sinusoidal forcing function of the same frequency (five radians per second) as the natural frequency of the system under test. Computing/plotting interval is 0.05. The equal real parts of the forcing function have been made to differ by an amount 1×10^{-8} .

NOBUS-Z™ \$2295

for Business *and* Home

A PROFESSIONAL MICROCOMPUTER AT AN AFFORDABLE PRICE

The NOBUS-Z COMPUTER has the hardware features needed for today's sophisticated small business, scientific, educational and personal systems.

- **SINGLE BOARD TECHNOLOGY**
- **4MHZ Z80A**
- **64K 200ns RAM**
- **8-INCH DRIVE DUAL DENSITY**
- **CP/M® OPERATING SYSTEM**
- **GRAPHICS IN COLOR**
- **SOUND GENERATOR**
- **2-SERIAL PORTS**
- **2-PARALLEL PORTS**
- **4-COUNTER/TIMERS**

Order a NOBUS-Z from your local Computer Dealer or write to EXO ELECTRONICS for complete information. OEM inquiries welcome. CIRCLE 134 ON THE INQUIRY CARD

DOLLAR FOR DOLLAR YOU WON'T FIND A BETTER SYSTEM

EXO ELECTRONICS supplies complete integrated systems centered around our NOBUS-Z. Professional CRT editing terminals and line printers round out our hardware offering. Fully supported software languages and packages supply the muscle for the system. Business and Scientific Basics, FORTRAN, Pascal and COBOL are available. We offer a complete line of business systems including accounts payable/receivable, payroll, inventory, data base management, and a complete full screen edit word processing system.

VERSATILITY: A 4MHZ Z80A microprocessor and CP/M give you the most powerful processor and operating system available today. 64K RAM is provided and parity checking is standard for critical applications. Up to four single or double density, 8 or 5 inch soft-sectored floppy disk drives are handled by the on-board controller. A video output gives dazzling displays on your TV set. A separate 6K bank of memory allows up to 256x192 pixel graphics without contending for main system memory. Text and

graphics can be mixed on-screen under program control with up to 16 rows of 32 characters of text. With our optional stand-alone keyboard and your TV the NOBUS-Z can be operated without a separate terminal. All electronics are socketed and readily serviceable on a single board.

ELECTRONICS
COMPANY**

P.O. BOX 3571 CULVER CITY, CALIFORNIA 90230 (213) 390-6527

Figure 11: Computed transient response of the transfer function used in figure 7, when subjected to a unit sinusoidal forcing function of ten radians per second, or twice the natural frequency of the system in question. While the computing/plotting interval of 0.05 is too large to give a smooth curve, the non-iterative solution ensures that all points plotted lie on the "true" response curve.

and the real part of the repeated root ($s=0$) has been made negligible (1×10^{-8}) in relation to the other roots. Due to the 12-point accuracy employed by the HP9830A, roots smaller than 1×10^{-8} should not be used when handling trigonometric functions such as arctangent. Similarly, any two roots must have a difference that is greater than 1×10^{-8} . While equation 13 may be solved using a value of 1×10^{-10} for the root at $s=0$, the accuracy decreases rapidly, and the solution becomes meaningless with a value of 1×10^{-12} . However, a root of 1×10^{-8} would represent a time constant of 3.17 years. If, for any reason, the time constants are in the order of months or years, then the whole problem should be time-scaled before programming.

The solutions to equations 12 and 13 are plotted in figures 8 and 9 respectively.

In educational environments, these digital simulations help emphasize the transient behavior of systems subjected to sinusoidal forcing functions, without the possibility of causing a system overload. Figure 10 illustrates the effect of inputting equation 11 with a unit sine wave

$$v_i(t) = \sin(\omega t) \quad V_i(s) = \frac{\omega}{s^2 + \omega^2}$$

with a frequency of 5 radians per second, that being equal to the natural frequency of the system. Since $\zeta = 0.1$, this is almost the resonant frequency.

Figure 11 illustrates the effect of inputting equation 11 with a unit, 10 radians per second sine wave, which is twice the natural frequency of the system.

While the axis labels in figures 7 thru 10 are most convenient for the presentation of those results, the printout employed in figure 11 is more versatile when a great number of amplitudes and time scales are expected. ■

Model DMB-6400 Series dynamic 64k byte RAMS incorporate the features which are standard in the DM-6400 Series and adds bank select for multi-user-timesharing applications.

- ALPHA MICRO, CROMEMCO, and NORTH STAR output port bank select.
- Memory bank size can be incremented to 64k bytes in 16k increments.
- Four (4) 16k byte, functionally independent memory banks.
- Eight (8) 64k byte banks of memory per output port for expansion to 512k bytes for each output port.

Model DM-6400 Series dynamic 64k memory boards feature IEEE S-100 compatible timing and on board transparent refresh.

- Memory selectable and deselectable in 4k byte increments.
- 25 MHz on board crystal oscillator for independent timing.

DMB-6400 and DM-6400 Common Features:

- 4 MHz Z80 operation with no wait states.
- Tested and burned-in.
- Low power- 8 watts maximum.
- Reliable, expandable memories.

3rd Generation S-100: Chosen by Professionals, Supported by CompuPro™

Why S-100? Because S-100 machines are not consumer-oriented, all-in-one microcomputers — but flexible, modular, professional-level systems that are easy to upgrade, modify, and adapt to specific applications. As a result, over the years the S-100 buss has proven to be the ideal choice for commercial, industrial, and scientific applications. It doesn't obsolete itself, but simply adapts to innovation.

We use the experience we've acquired in the past, coupled with the very best technology offered by the present, to build products for the future . . . products that meet, and often exceed, the demands of the new wave of professional S-100 users. Our expanded S-100 line is the right approach at the right time; we invite you to write for further information.

NEW! HIGH-PERFORMANCE S-100 MOTHERBOARDS

19 slot: \$174 unkit*, \$214 assm
12 slot: \$129 unkit*, \$169 assm
6 slot: \$ 89 unkit*, \$129 assm

*Edge connectors and termination resistors are pre-soldered in place for assembly.
These 3rd generation motherboards, designed to work with the latest 5 and 10 MHz CPUs coming on line, exceed the latest S-100 specs and offer superior performance. Includes true active termination (with half of the termination load at each end of every buss line), grounded Faraday shield between all buss signal lines to minimize crosstalk, and edge connectors included for all slots. All sizes fit Godbout, Vector, TEI, IMSAI, and similar enclosures.
These high quality motherboards are a welcome addition to any system — or the start of a great one.

2S "Interfacer" S-100 I/O board

\$189 unkit, \$249 assm, \$324 CSC

Dual serial port with 2 full duplex parallel ports for RS-232C handshake; EIA232C line drivers and receivers (1488, 1489) along with current loop (20 mA) and TTL signals on both ports. On-board crystal controlled timebase with independently selectable Baud rate generators for each port (up to 19.2 KBaud). Hardware UARTs don't tie up the CPU. And, there's much more . . . this is a no-excuses serial board that does things the others only dream about.

NEW! 3P + S "Interfacer II" S-100 I/O board

\$189 unkit, \$249 assm, \$324 CSC

Incorporates 1 channel of RS-232 serial I/O (with all the features of a port from the 2S "Interfacer", including handshaking), along with 3 full duplex parallel ports. The parallel section uses LSTTL octal latches for latched input and output data with 24 mA drive current, attention/enable/and strobe bits for each parallel port (with selectable polarity), interrupts for each input port, and separate 25 pin connectors with power for each channel along with a status port for interrupt mask and port status. All in all, this is an incredibly versatile and flexible board.

2708 S-100 EROM board

\$85 unkit

4 independently addressable 4K blocks, with dipswitch selectable jump start built right into the board. Includes all support chips and manual, but does not include EROMs.

Active Terminator Board

\$34.50 kit

Plugs into any S-100 motherboard (although ours don't need it) to reduce ringing, noise, crosstalk, and other buss-related problems. Here is an upgrade that is simple and effective.

The Godbout Box!

By the time you read this, we will be shipping our industrial-grade enclosure. It's perfectly suited to creating a powerful system based on our line of S-100 boards (or anyone else's, if you're so inclined). It's rack mount or desk mount (with sliders for pulling it out of the rack if desired), neat-looking, heavy duty, and comes with the back panel pre-punched to accept a variety of connectors. Oh yes, and let's not forget the power supply for powering all your boards; it comes with the box, too. See your computer store for details, or write us direct.

NEW! "MEMORY MANAGER" S-100 board

\$59 kit, \$85 assm, \$100 CSC

Now you can add bank select and extended addressing to older S-100 machines like the Altair, IMSAI, Sol, Polymorphic, etc. Either use this board with our new extended addressing boards, or retrofit our high density Econorams (the ones with phantom or extra qualifier lines) for use with the Memory Manager Board to get up to 1/2 a megabyte of memory space for your computer.

We supply memory

All our Econoram* memory is fully static, zips along at 4 MHz with the Z-80 or 5 MHz with the 8085, supports a number of popular busses, is available from us through computer stores world-wide, includes a 1 year limited warranty, and comes in three configurations to suit your needs. For lowest cost, choose an "unkit" with sockets and bypass caps pre-soldered in place for an easy, one-evening assembly. When you just can't wait to get going, order our assembled and tested version. For critical systems, specify boards qualified under our **Certified System Component (CSC)** high-reliability program. These boards are extensively tested, burned in for 200 hours, and are immediately replaced in event of failure within 1 year of invoice date. Refer to chart below for pricing.

By Netronics

ASCII/BAUDOT, STAND ALONE

Computer Terminal

COMPLETE FOR ONLY \$149⁹⁵

The Netronics ASCII/BAUDOT Computer Terminal Kit is a microprocessor-controlled, stand alone keyboard/terminal requiring no computer memory or software. It allows the use of either a 64 or 32 character by 16 line professional display format with selectable baud rate, RS232-C or 20 ma. output, full cursor control and 75 ohm composite video output.

The keyboard follows the standard typewriter configuration and generates the entire 128 character ASCII upper/lower case set with 96 printable characters. Features include onboard regulators, selectable parity, shift lock key, alpha lock jumper, a drive capability of one TTY load, and the ability to mate directly with almost any computer, including the new Explorer/85 and ELF products by Netronics.

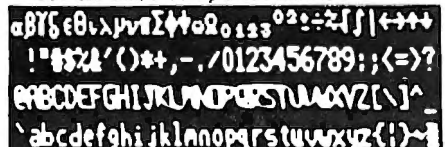

The Computer Terminal requires no I/O mapping and includes 1k of memory, character generator, 2 key rollover, processor controlled cursor control, parallel ASCII/BAUDOT to serial conversion and serial to video processing—fully crystal controlled for superb accuracy. PC boards are the highest quality glass epoxy for the ultimate in reliability and long life.

VIDEO DISPLAY SPECIFICATIONS

The heart of the Netronics Computer Terminal is the microprocessor-controlled Netronics Video Display Board (VID) which allows the terminal to utilize either a parallel ASCII or BAUDOT signal source. The VID converts the parallel data to serial data which is then formatted to either RS232-C or 20 ma. current loop output, which can be connected to the serial I/O on your computer or other interface, i.e., Modem.

When connected to a computer, the computer must echo the character received. This data is received by the VID which processes the information, converting to data to video suitable to be displayed on a TV set (using an RF modulator) or on a video monitor. The VID generates the cursor, horizontal and vertical sync pulses and performs the housekeeping relative to which character and where it is to be displayed on the screen.

Video Output: 1.5 P/P into 75 ohm (EIA RS-170) • **Baud Rate:** 110 and 300 ASCII • **Outputs:** RS232-C or 20 ma. current loop • **ASCII Character Set:** 128 printable characters—

BAUDOT Character Set: ABCDEFGHIJKLMNO PQRSTU VWXY Z - ? * 3 \$ # ! . , ' 9 0 1 4 5 7 ; 2 / 6 8 * **Cursor Modes:** Home, Backspace, Horizontal Tab, Line Feed, Vertical Tab, Carriage Return. Two special cursor sequences are provided for absolute and relative X-Y cursor addressing • **Cursor Control:** Erase, End of Line, Erase of Screen, Form Feed, Delete • **Monitor Operation:** 50 or 60Hz (jumper selectable).

Start Computing For Just \$129.95 With An 8085-Based Professional Computer Kit—

Explorer/85

100% compatible with all 8080A and 8085 software & development tools!

No matter what your future computing plans may be, Level "A"—at \$129.95—is your starting point.

Starting at just \$129.95 for a Level "A" operating system, you can now build the exact computer you want. Explorer/85 can be your beginner's system, OEM controller, or IBM-formatted 8" disk small business system... you're never forced to spend a penny for a component or feature you don't want and you can expand in small, affordable steps!

Now, for just \$129.95, you can own the first level of a fully expandable computer with professional capabilities—a computer which features the advanced Intel 8085 cpu, thereby giving you immediate access to all software and development tools that exist for both the 8085 and its 8080A predecessor (they are 100% software compatible)—a computer which features onboard S-100 bus expansion—plus instant conversion to mass storage disk memory with either 5-1/4" diskettes or standard IBM-formatted 8" disks.

For just \$129.95 (plus the cost of a power supply, keyboard/terminal and RF modulator, if you don't have them already), Explorer/85 lets you begin computing on a significant level... applying the principles discussed in leading computer magazines... developing "state of the art" computer solutions for both the industrial and leisure environment.

Level "A" Specifications

Explorer/85's Level "A" system features the advanced Intel 8085 cpu, an 8355 ROM with 2k deluxe monitor/operating system, and an 8155 ROM-I/O—all on a single motherboard with room for RAM/ROM/PROM/EPROM and S-100 expansion, plus generous prototyping space.

(Level "A" makes a perfect OEM controller for industrial applications and is available in a special Hex Version which can be programmed using the Netronics Hex Keypad/Display.)

Level "A" at \$129.95 is a complete operating system, perfect for beginners, hobbyists, or industrial controller use.

Level "A" features: cassette tape recorder output... speaker output... LED output indicator on SOD (serial output) line... printer interface (less drivers)... total of four 8-bit plus one 6-bit I/O ports • Crystal Frequency: 6.144 MHz • Control Switches: reset and user (RST 7.5) interrupt... additional provisions for RST 5.5, 6.5 and TRAP interrupts onboard • Counter/Timer: programmable, 14-bit binary • System RAM: 256 bytes located at F800, ideal for smaller systems and for use as an isolated stack area in expanded systems... RAM expandable to 64k via S-100 bus or 4K on motherboard.

System Monitor (Terminal Version): 2k bytes of deluxe system monitor ROM located at F000 leaving 0000 free for user RAM/ROM. Features include tape load with labeling... tape dump with labeling... examine/change contents of memory... insert data... warm start... examine and change all registers... single step with register display at each break point, a debugging/training feature... go to execution address... move blocks of memory from one location to another... fill blocks of memory with a constant... display blocks of memory... automatic baud rate selection... variable display line length control (1-255 characters/line)... channelized I/O monitor routine with 8-bit parallel output for high speed printer... serial console in and console out channel so that monitor can communicate with I/O ports.

System Monitor (Hex Version): Tape load with labeling... tape dump with labeling... examine/change contents of memory... insert data... warm start... examine and change all

- ASCII Keyboard/Computer Terminal Kit (features a full 128 character set, upper & lower case, full cursor control, 75 ohm video output convertible to baudot output, selectable baud rate, RS232-C or 20 ma. I/O, 32 or 64 character by 16 line formats, and can be used with either a CRT monitor or a TV set (if you have an RF modulator), \$149.95 plus \$2.50 p&h.
- Hex Keypad/Display Kit, \$69.95 plus \$2 p&h.
- Deluxe Steel Cabinet for ASCII Keyboard/Terminal, \$19.95 plus \$2.50 p&h.
- Power Supply Kit (±8V @ 5 amps) in deluxe steel cabinet, \$39.95 plus \$2 p&h.
- Gold Plated S-100 Bus Connectors, \$4.85 each, postpaid.
- RF Modulator Kit (allows you to use your TV set as a monitor), \$8.95 postpaid.
- 16k RAM Kit (S-100 Board expands to 64k), \$199.95 plus \$2 p&h.
- 32k RAM Kit, \$329.95 plus \$2 p&h.
- 48k RAM Kit, \$459.95 plus \$2 p&h.
- 64k RAM Kit, \$589.95 plus \$2 p&h.
- 16k RAM Expansion Kit (to expand any of the above up to 64k), \$139.95 plus \$2 p&h each.
- Intel 8085 cpu User's Manual, \$7.50 postpaid.
- Special Computer Grade Cassette Tapes, \$1.90 each or 3 for \$5, postpaid.
- 12" Video Monitor (10 MHz bandwidth), \$139.95 plus \$5 p&h.
- North Star Double Density Floppy Disk Kit (One Drive) for Explorer/85 (includes 3 drive S-100 controller, DOS, and extended BASIC with per-

registers... single step with register display at each break point... go to execution address. Level "A" in the Hex Version makes a perfect controller for industrial applications and can be programmed using the Netronics Hex Keypad/Display.

Calculator type keypad with 24 system defined and 16 user defined keys. 6 digit calculator type display which displays full address plus data as well as register and status information.

Level "B" Specifications

Level "B" provides the S-100 signals plus buffers/drivers to support up to six S-100 bus boards and includes: address decoding for onboard 4k RAM expansion select-able in 4k blocks... address decoding for onboard 8k EPROM expansion select-able in 8k blocks... address and data bus drivers for onboard expansion... wait state generator (jumper selectable), to allow the use of slower memories... two separate 5 volt regulators.

Level "C" expands Explorer's motherboard with a card cage, allowing you to plug up to six S-100 cards directly into the motherboard. Both cage and cards are neatly contained inside Explorer's deluxe steel cabinet.

Level "C" includes a sheet metal superstructure, a 5-card gold plated S-100 extension PC board which plugs into the motherboard. Just add required number of S-100 connectors

Level "D" Specifications

Level "D" provides 4k or RAM, power supply regulation, filtering decoupling components and sockets to expand your Explorer/85 memory to 4k (plus the original 256 bytes located in the 8155A). The static RAM can be located anywhere from 0000 to EFFF in 4k blocks.

Level "E" Specifications

Level "E" adds sockets for 8k of EPROM to use the popular Intel 2716 or the TI 2516. It includes all sockets, power supply regulator, heat sink, filtering and decoupling components. Sockets may also be used for soon to be available RAM IC's (allowing for up to 12k of onboard RAM).

Order A Coordinated Explorer/85 Applications Pak!

Experimenter's Pak (SAVE \$12.50)—Buy Level "A" and Hex Keypad/Display for \$199.90 and get FREE Intel 8085 user's manual plus FREE postage & handling!

Student Pak (SAVE \$24.45)—Buy Level "A," ASCII Keyboard/Computer Terminal, and Power Supply for \$319.85 and get FREE RF Modulator plus FREE Intel 8085 user's manual plus FREE postage & handling!

Engineering Pak (SAVE \$41.00)—Buy Levels "A," "B," "C," "D," and "E" with Power Supply, ASCII Keyboard/Computer Terminal, and six S-100 Bus Connectors for \$514.75 and get 10 FREE computer grade cassette tapes plus FREE 8085 user's manual plus FREE postage & handling!

Business Pak (SAVE \$89.95)—Buy Explorer/85 Levels "A," "B," and "C" (with cabinet), Power Supply, ASCII Keyboard/Computer Terminal (with cabinet), 16k RAM, 12" Video Monitor, North Star S-1/4" Disk Drive (includes North Star BASIC) with power supply and cabinet, all for just \$1599.40 and get 10 FREE 5-1/4" minidiskettes (\$49.95 value) plus FREE 8085 user's manual plus FREE postage & handling!

IS YOUR Z80 HALF ASLEEP?

Don't settle for less than the total performance built into your Z80 Computer. Wake up its entire potential with an OASIS Operating System—the high-powered, professional software package that takes full advantage of Z80 power.

Utilizing optimized Z80 code, OASIS makes the system run faster. More and better tools let you develop software faster, too.

It's easy to use because all the tools you need are included: ISAM files, hard and floppy disk support, editor, user accounting with logon, password privilege level, and file security. Options: BASIC Compiler, spooler, text editor and output processor,

development package, and more.

The BASIC Compiler is also an interpreter, complete with debugger. It makes programs run faster, takes less memory, and provides software security. A first for micros, it's an OASIS exclusive.

FEATURES: Single- & Multi-User/User Accounting/Multi-Tasking/ File & Record Security/Logon Password & Privilege Protection/ Keyed (ISAM), Direct & Sequential Files/Hard & Floppy Disk Support/ Extensive Documentation

OASIS PRODUCTS: Single-User Operating System/ Multi-User Operating System/Macro Re-locating Assembler/ Debugger/ Linker/Editor/ Output Text Formatter/ Spooler/ Communications Package/Sort/ Diagnostic & Maintenance Utilities/ Interactive EXEC Language/ Re-entrant BASIC Compiler

OASIS IS AVAILABLE FOR: Altos/ Billings/ Digital Microsystems/ Digital Group/ Cromemco/Vecor Graphic/ Micromation/ CompuCorp/ North Star/ Onyx/ Bell Controls/ TRS-80 Mod II/ Vortex and others

Multi-User OASIS, available for most computer configurations, gets even more performance out of your system. It has all the Single-User features, PLUS a re-entrant BASIC Compiler, file and record locking, variable time-slicing, user-to-user communications, and extended memory addressing. All fully upward compatible with Single-User.

Documentation?...complete and extensive. And, of course, there's plenty of application software.

OASIS operating systems, languages, development packages, system utilities—all fully integrated, all from one source.

Ask your dealer or manufacturer. Or send the coupon direct, today.

MAKES MICROS RUN LIKE MINIS.

POSTMASTER

Tomorrow's mail system. Today.

One package does it ALL.

Postmaster offers the most powerful and flexible mail-management system available.

Batch Entry: Entering names and addresses to a mailing list is simple. Repeated elements of a record need only be entered once.

Powerful Record Extraction: Used in conjunction with the **Optional Reference Field**, this feature allows simple creation of user specified "target-files."

Dedicated Record Editor: List, modify or delete records. Allows intact or extracted backup of original file.

Automatic "ID" Field Insertion: (optional) Key in a name, and a unique 10 character record identifier will be entered automatically to the Reference area.

Envelopes: Postmaster prepares single or continuous envelopes.

Mailing Labels: Standard or user-specified formats up to five across are supported by Postmaster. User may specify any number of labels per name.

Form Letters: Prepare and edit form letters in a variety of formats, on either single or continuous forms. Optional capability of allowing text or salutation "Inserts" for some or all letters in any print run.

Dedicated Record Sorting: Sorted files are re-written to disk. The sort may be in either ascending or descending order. Uses the FAST Shell-Metzner sorting algorithm.

Attractive Reports: Neat, paginated reports on either 80 or 132 column paper. The 80 column option allows your CRT to provide an attractive report display.

Clear, Complete Documentation: The manual will explain in simple English how to get started right away. Sample data and form-letter files are included on the disk to allow new users to experiment (learn) quickly.

Quality That's Affordable and Available: The Postmaster programs are available in a variety of 5" and 8" disk formats (40k of RAM, CP/M and CBASIC2 are required). Among the formats supported are TRS-80, North Star, Heath H8 and H89, standard 8" IBM, Vector MZ and other CP/M derivatives capable of running CBASIC.

COMPLETE PACKAGE: \$150.
MANUAL ALONE: \$15.

(Credited toward subsequent purchase)

LIFEBOAT ASSOCIATES

2248 Broadway, New York, N.Y. 10024 □ (212) 580-0082 □ Telex: 668585

Text continued from page 82:

cates that double buffered animation is available, MAXC mode has 15 colors and 64 by 64 resolution, the display is in color, and MAXR mode has one color and 128 by 128 resolution.

8080/Dazzler Page

The PAGE routine takes advantage of the hardware requirement that refresh buffers start only on even page boundaries and are 2 K bytes long. The low-byte of the address is used for a free zero, while the HL register is incremented until H corresponds to the high-byte of the first address beyond the buffer.

8080/Dazzler Cursor

Since the same scaling routine is used for both CURSOR and LINE, CURSOR becomes an almost empty routine. Aside from preserving registers, all it does is call CU000 with the coordinates presented, and save the scaled result as the new software cursor position XPOS, YPOS.

The MODE byte engages in some trickery to indicate the desired mode efficiently. The numeric value associated with the mode is rotated right one bit position. The resultant value can be incremented up to 126 times and still remain negative if in MAXC or R64 mode, and positive if in MAXR or R128 mode. Since MAXR on the Dazzler is 128 by 128 resolution, and MAXC is 64 by 64, we have a simple test to determine which mode is in use.

The scale routine CU000 divides X and Y by 2, checks to see if R128 or MAXR is selected, and divides again if they are not.

8080/Dazzler DOT

This routine tends to be somewhat complex due to the convoluted mapping from bits in the byte to points on the screen used by the Dazzler in 128 by 128 resolution mode, and the dividing of the screen into four quadrants. Fortunately, if the 128 by 128 coordinates are divided by 2, the address and mask generated by applying the algorithm for 64 by 64 resolution yields the four bits corresponding to the four possible 128 by 128 points. The low-order bits of the X and Y coordinates lost in the division are then used to select the single bit corresponding to the desired point.

The four quadrant problem is similarly solved by using the high-order bit of each coordinate to determine the quadrant, and the remaining lower order bits to find the location inside the quadrant. Since these problems are unique to the Dazzler, they will not be discussed further. The interested reader is invited to trace the logic in the program listing.

One final comment on the DOT routine is appropriate. The DOT register restore sequence is also used by LINE and CHAR. If it is changed, the appropriate modifications will also be required in LINE and CHAR.

8080/Dazzler LINE

The LINE routine is almost a block-for-block encoding of the LINE algorithm. The variable name correspondence table (table 8) is provided as a cross-reference guide, since some of the variable names used in the algorithm were modified.

Because the values of XP and YP are lost when the cursor adjustments for "move 0" and "move 1" are looked up, initialization of variables is moved to immediately after sector determination. TA and T0 are both 16-bit numbers because they represent the product of two 8-bit numbers. The only 16-bit arithmetic available on the 8080 is addition. To subtract X from T0, the 16-bit two's complement of X, DX, is calculated and added. Similarly, DY is the 16-bit representation of Y.

The cursor adjustments required for a "move 0" and a "move 1" are looked up in the table MXT. Entries are indexed by sector weight. Each entry is four bytes long (MOX, MOY, M1X, and M1Y for the particular sector), so the sector weight is multiplied by 4 (two shifts left) and added to the starting address of the table. The correct cursor adjustments are then retrieved and stored where access is more convenient.

The only other significant change to the logic is the placement of the test for completion. For efficiency, x is compared to X immediately after the point is displayed. This has the added advantage of occurring at the only time the stack is free of temporary variables.

8080/Dazzler CHAR

The CHAR routine, with the exception of control character processing, also follows its Nassi-Schneiderman chart rigorously. The major change has been to convert to a SELECT construct the string of IFs used for control character processing. This avoids a multitude of tests which are guaranteed to fail once the character has been recognized. The processing of control characters with similar actions has also been consolidated to reduce redundancy.

As is obvious from its Nassi-Schneiderman chart, CHAR is really two independent routines with a common entry point. The only common code is the register saving and parity stripping. By pushing the address of the restore register routine onto the top of the stack, the return (RET) instruction will jump to the restore register sequence, restore all registers, and then return to the calling program.

The character matrix table is indexed by ASCII value minus 32, ie: the first entry is a blank. Since each entry is

Table 8: Variable name definitions for LINE.

8080 Software	Algorithm Description
XT	x
YT (not used)	y
XP	X
YP	Y
XPOS or XC	XC
YPOS or YC	YC
XF	XF
YF	YF
TA	TA
T0	T0
DX	-X
DY	+Y
MOX, MOY	Cursor adjustment for a "Move 0"
M1X, M1Y	Cursor adjustment for a "Move 1"

Note: The table numbering sequence is continued from part 1.

Up Your Output.

MULTI-TASKING!

The TEMPOS Operating System is quickly becoming the standard in Multi-User, Multi-Tasking operating systems for 8080 and Z80 microcomputers. Multi-Tasking means that, even with only one user at one terminal, more than one job can be running on the system *simultaneously!* If you have ever had to go get a cup of coffee while you wait for your computer to print listings, you know the advantages of a system that will handle one job while you are working on another. TEMPOS is a true time sharing system, and the maximum number of jobs is limited only by your memory.

MULTI-USER!

Want to share your computer with another user? With TEMPOS all it takes is another terminal... up to seven interactive terminals are allowed! And with Re-Entrant programs, each user does not need a complete copy in memory. We include three Re-Entrant programs (the OPUS/THREE High-Level Language, the TEXTED Text Editor, and FILES, a disc file directory/manipulator) or write your own! In addition, we include an assembler, a linking loader, over a half-dozen other utility programs and over 60 system subroutines, callable by the programmer!

PROVEN!

With TEMPOS, you get a package that has been tested in our facilities for over two years, and in the field at over 50 different installations. We have used this system ourselves for everything from writing high-level languages to developing applications to text editing to games. TEMPOS is undoubtedly the most flexible software tool on the market... and you can have it for much less than you think!

COMPATIBLE!

TEMPOS is available for many different systems; pre-written drivers may include yours. Or, using our interactive System Generation Routine, you can add your own. Call or write now for our free catalog and the name of a dealer near you. The TEMPOS Operating System is available for \$787.00, the manual set (price may be credited toward the purchase of the TEMPOS package) for \$21.50 (prices include shipping within the U.S.).

1642 S. Parker Road, Suite 300, Denver, Colorado 80231
(303) 755-9694

three bytes long, the index must be multiplied by 3 to get the offset into the table. (The format of the character table is fully defined in the comments preceding it in the listing.) The first byte of each entry contains all the flags describing the character. The width bits are masked off and the cursor value for the next character position calculated. If the width is 6 (including a blank pixel between characters) the special subroutine to generate the first column of a 5-column wide character is executed. The descender indicator flag is then checked and the cursor is adjusted if necessary.

The normal character generation code scans the character matrix row-by-row. Whenever a 1 is encountered, the DOT routine is called to display the pixel at that location. When all five rows are completed, the cursor value is set for the next character position as calculated earlier, and control returned to the calling program.

The special subroutine used for five wide characters generates only the first column. By incrementing the cursor position, the normal character generation sequence is used to generate columns 2 through 5 instead of the normal 1 through 4.

Control character handling proceeds in three phases. Phase 1 checks for any of the four mode controls and sets MODE as required. The Dazzler hardware must also be informed so it can change mode. Phase 2 is entered if the control character is not a mode control. This is an individual check for each of the carriage control characters. Note that to get to the top line, form feed must determine what resolution is in use. Phase 3, if reached, is current color selection. The value of the control character is first

checked to verify that it actually is a color select character. If it is black, the COLOR byte is set to all zeros. If any other color, a check is made to determine if the Dazzler is in a color supporting mode (MAXC or R64). If not, COLOR is set to all ones (high-resolution white). If a color mode is in use, the bright bit is set and the low-order four bits are duplicated in the high-half of the byte to yield a COLOR byte with the desired color in both pixel fields. Conveniently, the Dazzler color bit definitions match the lower three bits of the color select character.

A word of caution is in order for anyone using the compiler hexadecimal output in the listing directly, rather than the source code. The character table contains more bytes per line than the compiler used allocates for listing purposes (hence the "D" error). One must load the character table from the source code rather than from the compiler's hexadecimal output.

8080/Dazzler ANIMAT

The ANIMAT routine's implementation is adequately described in the comments on the listing. The flag byte ANIM indicates whether the first 2 K buffer or the second (auxiliary) 2 K buffer is currently being filled. Note that if the buffer swap were made as soon as vertical blanking was detected rather than as soon as vertical blanking was detected following an absence of vertical blanking, it would be possible to swap buffers, modify the display, and swap buffers again—all during one vertical blanking period. The net result, of course, would be that the one buffer would never be displayed, a clearly undesirable circumstance.

MICROSOFT CONSUMER PRODUCTS CONTINUING THE MICROSOFT TRADITION

Microsoft set the standard in microcomputer system software. We know more about the structure and capabilities of today's microcomputers than anyone else. And now we're using that power in a whole new way!

Announcing Microsoft Consumer Products. Distinctive software packages backed by the Microsoft name. Each is created by a top-notch programmer and comes to you fully documented, at a cost you can afford.

Microsoft Editor/Assembler-Plus.[™] Now get every feature of Radio Shack's Editor/Assembler and T-Bug all in one package. PLUS—many "big computer" features to simplify your programming, editing and debugging. All in a low cost cassette package. Don't waste time creating both source and object tapes—Assembler-Plus assembles directly into memory. Supports macros and conditional assembly, too. Editor-Plus simplifies editing with extra commands like Substitute, Move, Copy and Extend. And Z-Bug;[™] the most powerful debugger ever available for the TRS-80, has single step execution, direct execution in calculator mode and symbolic references. And, you can use up to 8 breakpoints at a time, with no need to remove a breakpoint before proceeding. For the 16K, Level II, cassette TRS-80. Priced at \$29.95.

Microsoft Adventure. Only Microsoft offers Adventure complete, as originally written for the DEC PDP-10, now implemented on personal computers. The ultimate fantasy/logic game, Adventure allows you to explore the depths of the "Colossal Cave," collecting treasures and magic, solving puzzles, avoiding hazards and adversaries—including the dreaded killer dwarves. Don't be fooled by imitation or incomplete versions. Only Microsoft has it all. Adventure fills an entire disk with everything you need for your exploration. Written by Gordon Letwin, of SOFTWIN, Associates. Adventure for the TRS-80 requires a single-disk, 32K system. For the Apple II,^{*} a single-disk, 32K system with either the standard disk or language card system. For just \$29.95.

Microsoft Typing Tutor. There's no easier way to master your keyboard! Faster and more efficient than any other teaching method, Typing Tutor helps you if you're starting from scratch or simply building speed. The secret lies in Typing Tutor's exclusive TRM[™] or "Time Response Monitoring" software. TRM monitors your keyboard 20 times per second so the computer can evaluate your skill. Your speed. Your errors. Your weakest keys. Typing Tutor tells you where you stand then automatically adjusts itself to help you improve. Written by Dick Ainsworth and Al Baker of the Image Producers, Inc. For the Apple II with 16K and Apple BASIC or the TRS-80 with 16K and Level II BASIC. Priced at \$14.95.

Microsoft Level III BASIC. Upgrade your Level II TRS-80 and increase your programming efficiency without additional hardware. Microsoft Level III loads from cassette tape on top of the Level II ROM. It gives you every feature of Disk BASIC except disk file commands. But that's not all—Level III's high-speed graphics turn your TRS-80^{*} into a virtual electronic drawing board. And there's program renumbering, long error messages, quick shift-key entries, time-limit INPUT statements and many more features. System requirements: Level II BASIC and 16K. Occupies 5.2K RAM. Priced at \$49.95.

Where To Buy. Microsoft Consumer Products are sold by computer retailers nationwide. If your local computer store doesn't have them, call us. Phone (206) 454-1315. Or write Microsoft Consumer Products, 10800 Northeast Eighth, Suite 819, Bellevue, WA 98004.

*TRS-80 is a trademark of Radio Shack Corp. **Apple II is a trademark of Apple Computer, Inc.,[™] Editor/Assembler-Plus and Z-Bug are trademarks of Microsoft. TRM is a trademark of The Image Producers, Inc.

Photo 1: Display generated by demonstration program number 2 (see listing 2).

Photo 2: Display generated by demonstration program number 3 (see listing 2).

Demonstration Program

The demonstration program (see listing 2 on page 184) is provided for several purposes. Aside from demonstrating the power of the protocols, it serves as a tutorial in using the 8080 assembly language protocol and as a debugged, working user program for verifying successful implementation of the 8080 assembly language protocol. The photographs illustrating this article were all generated by this program and a Matrox ALT-256**2 display. The program contains four independent demonstrations and two utility subroutines. Equates are used to allow mnemonic references to the standard protocol's entry vectors, color controls, and display modes.

The first demonstration is a maximum-resolution exercise for the line generator. The identification message uses R64 resolution deliberately to get large characters. A series of maximum-length lines are drawn to generate the string art parabolas in each corner. The calculation of the endpoints of all the lines is simplified by the standard coordinate system. Their spacing is controlled by the value for MRSCFL returned by INITG. Because of the speed of generation, a variable delay utility subroutine, PAUSE, is used to give time to observe the display. These pauses may be extended indefinitely by setting the switch register to hexadecimal 01.

The second demonstration tests the generation of all 64 of the uppercase ASCII characters. Again, advantage is taken of the lowest resolution mode to display large characters. The 64 characters are drawn eight times, once in each color, in order to demonstrate the ability to vary the display dynamically. On the last iteration, the characters are drawn in black, leaving a clear screen. Rather than verify that the display is capable of selective erase, the PAGE routine is also called. The full range of available character sizes is then displayed using R64, MAXR, and R128 display modes for one line each. All mode changes are immediately followed by absolute cursor positioning commands to avoid erroneous results.

The third demonstration cycles through all available colors with the line generator. To avoid claiming Full Color Control on a monochrome display, the color bit in MAXCD is tested. MCCOLS is then checked to see how many colors or grey shades are available. All available colors are used, one at a time, as one end of each line is moved closer to (255,255). The attempt at mode RXXX, after shifting to R64, is ignored by the package in this article. The enhanced Dazzler package available from Cromemco uses it to select the Dazzler's 16-level grey scale mode.

The final demonstration is a short animation sequence. The header is inserted in both buffers. The auxiliary buffer must be cleared first, since this function is not included in the standard. If the display is not double buffered, this will also clear any warning messages generated by the graphics package.

The algorithm used to animate the figure will work with either double buffered displays or selectively erasable displays. For the former, the figure is backed up one step and drawn in black to erase it from the non-displaying buffer (PAGE would require too much time and erase the header). The figure is then advanced two steps to get to the position past the one currently being displayed and drawn in white. Finally, ANIMAT is called to display the updated buffer, and the whole procedure is repeated until the screen is traversed. If the display is not double buffered (tested using the ANIM field in MAXRD), the ANIMAT routine is called anyway to delay until the start of vertical blanking. While the display is busy with vertical blanking, the old figure is erased and the new one displayed. If all the changes can be made before the affected memory is displayed, there will not be any flicker, and the animation will be as smooth as when double buffering is used.

The STRING subroutine is a convenient utility for displaying text strings. It calls the CHAR routine with each successive character in a string of ASCII characters until an ASCII '\$' (hexadecimal 24) is detected.

Conclusion

The availability of a powerful graphics protocol immensely simplifies the design and coding of graphics programs. The limitations imposed by forcing individual capabilities to meet a common protocol are more than made up by the availability of precisely defined functions and controls. Furthermore, the protocol is sufficiently flexible to allow the installation and use of unique display features without adversely affecting the ability to run programs designed to the standard. For example, the

package available from Matrox for its ALT-256**2 contains such enhancements as high-resolution positioning of low-resolution DOTs, choice of fixed or proportional character spacing, and up to 8 bits (256 combinations) color and/or grey scale for each pixel.

The author would like to thank John Rogers, Gary Johnsey, and especially Bart Schwartz for their help in making these articles possible.

Graphics Interface Standard for FORTRAN

The following FORTRAN subroutine definitions extend the flexibility and hardware independence of the proposed microcomputer graphics standard to FORTRAN.

INITG (XMRSCl, YMRSCl, MRCOLs, XMCSCL, YMCSCl, MCCOLs, LANIM, LCOLOR)

Initialize graphics hardware and software to maximum resolution mode with all options disabled. The screen is cleared and the current color is set to white. Eight variables are used to return the display parameters:

XMRSCl (REAL*4) X dimension of physical display points in standard coordinates, maximum resolution mode.

YMRSCl (REAL*4) — as above except Y dimension.

MRCOLs (INTEGER*2) — colors (grey shades) available in maximum resolution mode.

XMCSCL (REAL*4) — X dimension of physical display points maximum colors mode.

YMCSCl (REAL*4) — as above except Y dimension.

MCCOLs (INTEGER*2) — colors (grey shades) available in maximum color selection mode.

LANIM (LOGICAL*1) — TRUE if double buffered animation available.

LCOLOR (LOGICAL*1) — TRUE if display is in color, FALSE implies monochrome.

PAGE

Clear the screen

CURSOR (IX, IY)

Move the cursor to the coordinate position specified.

IX (INTEGER*2) — X (horizontal) coordinate desired. Value is in standard display coordinates (0 through 255). Out of range values are permitted but

may have unpredictable results.

IY (INTEGER*2) — as above except Y (vertical) coordinate desired. Lower left-hand corner of the screen is the point 0,0.

DOT

Display a dot at the current cursor position using the current color.

LINE (IX, IY)

Display a line from the current cursor position to the coordinate position specified. IX and IY are defined as in CURSOR.

CHAR (ICHAR)

The ASCII character defined by the low-order 7 bits of ICHAR is displayed at the current cursor position. Control characters are interpreted as defined in the standard to change display mode, current color, etc.

ICHAR (INTEGER*2) — the ASCII character to be interpreted or displayed.

ANIM

Program execution is delayed until the start of the next vertical blanking period. If double buffered animation is supported, buffers are not switched until immediately before returning.

WRITE (10, nnn) var, var, ...

The logical unit number 10 is available for formatted output to the display. Binary output will result in an I/O (input/output) error. Input attempts will return End of File. Rewind, endfile, and backspace operations are no-ops. The display must be initialized by INITG before writing to LUN 10. The first character output on each line is interpreted as a standard FORTRAN printer control character (' ' for single space, '0' for double space, '1' for new page, and '+' to overprint the same line).

Sample Program

```
C--- Example usage of FORTRAN Standard Graphics Calls
      LOGICAL*1 LANIM, LCOLOR
C--- Initialize graphics
      CALL INITG(XMRSCl, YMRSCl, MRCOLs, XMCSCL,
1 YMCSCl, MCCOLs, LANIM, LCOLOR)
C--- Title display
      WRITE (10, 100)
100  FORMAT(1H1, 'A SINE WAVE')
C--- Calculate and display a sine wave
```

```
C--- Move to starting point
      CALL CURSOR (0, 128)
C--- Determine distance between X values
      INCR = IFIX (YMRSCl + 0.5)
      IF(INCR.LE.0) INCR = 1
C--- Draw the actual curve
      DO 1000 IX = INCR, 255, INCR
        X = 3.14159*FLOAT(IX)/64.0
        Y = SIN(X)*100.0
        IY = IFIX (Y + 128.0)
1000  CALL LINE (IX, IY)
      END
```

PET / TRS-80 / APPLE: Personal Software brings you the finest!

MICROCHESS

The Industry's First
Gold Cassette
Over 50,000 Sold

MICROCHESS is the industry's best selling computer game. And no wonder—because MICROCHESS gives you more than just a chessplaying program: A convenient, foolproof set of commands and error checks ... complete instructions in a 5½" by 8½" booklet ... a cassette that's guaranteed to load, with disk versions coming soon ... and several levels of difficulty to challenge you not just once, but time after time. It's available through well over three hundred computer stores and many mail order sources ... always

originating from Personal Software. What's more, every Personal Software product is selected to give you these same benefits of easy availability, reliable cassettes, readable documentation, a carefully thought out user interface ... and most important, continuing challenge and enjoyment, not just once but time after time. If you haven't already, order your own gold cassette: MICROCHESS, by Peter Jennings, for 8K **PETs**, 16K **APPLEs**, and 4K Level I and II **TRS-80s** **\$19.95**

TIME TREK

A Tour De Force
In Real Time Action
Strategy Games

TIME TREK by Brad Templeton for 8K **PETs** and Joshua Lavinsky for 4K Level I and II **TRS-80s** adds a dramatic new dimension to the classic Star Trek type strategy game: REAL TIME ACTION! You'll need fast reflexes as well as sharp wits to win in this constantly changing game. Be prepared—the Klingons will fire at you as you move, and will move themselves at the same time, even from quadrant to quadrant—but with practice you can change course and speed, aim and fire in one smooth motion, as fast as you can press the keys. Steer under power around obstacles—evade enemy

shots as they come towards you—lower your shields just long enough to fire your phasers, betting that you can get them back up in time! With nine levels of difficulty, this challenging game is easy to learn, yet takes most users months of play to master. ADD SOUND EFFECTS with a simple two-wire hookup to any audio amplifier; the TRS-80 also produces sound effects directly through the keyboard case, to accompany spectacular graphics explosions! You won't want to miss this memorable version of a favorite computer game **\$14.95**

BLOCKADE by Ken Anderson for 4K Level I and II **TRS-80s** is a real time action game for two players, with high speed graphics in machine language. Each player uses four keys to control the direction of a moving wall. Try to force your opponent into a collision without running into a wall yourself! A strategy game at lower speeds, BLOCKADE turns into a tense game of reflexes and coordination at faster rates. Play on a flat or spherical course at any of ten different speeds. You can hear SOUND EFFECTS through a nearby AM radio—expect some razzing if you lose! **\$14.95**

GRAPHICS PACKAGE by Dan Fylstra for 8K **PETs** includes programs for the most common 'practical' graphics applications: PLOTTER graphs both functions and data to a resolution of 80 by 50 points, with automatic scaling and labeling of the axes; BARPLOT produces horizontal and vertical, segmented and labeled bar graphs; LETTER displays messages in large block letters, using any alphanumeric or special character on the PET keyboard; and DOODLER can be used to create arbitrary screen patterns and save them on cassette or in a BASIC program **\$14.95**

ELECTRIC PAINTBRUSH by Ken Anderson for 4K Level I and II **TRS-80s**: Create dazzling real time graphics displays at speeds far beyond BASIC, by writing 'programs' consisting of simple graphics commands for a machine language interpreter. Commands let you draw lines, turn corners, change white to black, repeat previous steps, or call other programs. The ELECTRIC PAINTBRUSH manual shows you how to create a variety of fascinating artistic patterns including the one pictured. Show your friends some special effects they've never seen on a TV screen! **\$14.95**

WHERE TO GET IT: Look for the **Personal Software**® display rack at your local computer store. For the name and address of the dealer nearest you, call Personal Software at (408) 745-7841. If you don't have a dealer nearby, you can call or mail us your order with your check, money order or VISA/Master Charge card number. For a free catalog, ask your dealer or use the reader service card at the back of this magazine.

PERSONAL SOFTWARE INC.
592 WEDDELL DR. • SUNNYVALE, CA 94086

December 1, 1979

Oregon Software inc. minicomputer.

To the users of OMSI Pascal-1 for the PDP-11:

We are pleased to make available to you the new version (V1.2) of OMSI Pascal-1. V1.2 contains many enhancements and improvements, and you will find it easier to operate and even more reliable. The following overview outlines the most significant changes incorporated in the new version. For details, please ask for the V1.2 Language Specification and User's Guide(s).

Extended precision real arithmetic: a compiler switch causes all real calculations to be carried out with 15 digit precision (standard PDP-11 double precision four-word format). Extended precision is supported on all PDP-11 and LSI-11 processors, and on all operating systems. The precision of the library functions is also extended.

Debugger: the interactive debugger is now entirely Pascal-oriented, and is conversant with all user identifiers, types, scope rules, and the source program. The debugger has the capability, for example, to intercept a fatal error and display the last executed statements, or to accept and store commands for display of variables at a breakpoint.

Profiler: if you have ever wondered where your program spends its time, the Profiler can produce a listing and show you the number of times every line is executed.

Fatal error recovery: the system error procedure can be replaced by a Pascal-coded routine.

Direct access files: the procedure Seek(file,record) is a built-in procedure, and causes the file buffer to be positioned to any desired record.

File options: many enhancements have been made in file processing, allowing (for example) large buffers and spanned records on RSTS and RT11, and RSX file attributes including variable-length records. The RSTS file support uses 24-bit block numbers for RSTS V7 large file capability. All systems now support a full default filename when opening files.

Fast MACRO: most of the compilation time is actually spent in MACRO and the linking loader. On RSTS systems, a new utility (MAC) performs both of these functions in one-third of the time.

String package: included with V1.2 is a set of procedures and functions for handling dynamic length character strings. The package is written for portability in Standard Pascal.

Order information: to OMSI Pascal-1 licensees in warranty or extended support, V1.2 is available for the cost of handling, media, and shipping; other parties please contact Anne Smith, Vice-president for Sales.

Yours truly,

Donald Baccus

Vice-president, Software Engineering.

NEW!

Introduction to Low Resolution

GRAPHICS

Now you can produce amazing computer graphics — even if you can't draw a straight line. Literally! Learn how to draw lines and shapes, make graphs, draw pictures and even do animations. The simple secrets of how to do all this are contained in SCELBI's new book "Introduction to Low Resolution Graphics."

Today's exciting personal and small business computing machines are generally provided with at least some kind of "low resolution" graphics capability. What is low resolution graphics? It is graphics presented on a point-by-point basis where the number of points is limited to about 8000 or less. The APPLE II by APPLE Computers, Inc., the Radio Shack TRS-80 and the Commodore PET all have low resolution graphics capability. So do many other kinds of microcomputers.

What can you do with low resolution graphics? Lots of things . . .

Shows How to Draw

- *Straight lines*
- *Triangles*
- *Circles*
- *Elipses*
- *Borders*
- *Reverse backgrounds*
- *Deck of playing cards*
- *A clown that winks*
- *Football grid*
- *Animated football game*

In addition to these fundamentals of drawing and animation, the book tells how to synchronize computer-generated sounds to your illustrations.

If you know how! You can plot plain and simple or fancy and complex graphs to consolidate data, for business or pleasure purposes. But you can do so much more than that! You can use the capability to improve the presentation and impact of almost anything you want your computer to tell people. It can be used to animate games or data, clarify and amplify educational materials, or just plain entertain people. Get started putting your computer to new and exciting uses through the world of graphics. Anyone can learn and apply these easy-to-understand techniques. Order your copy today!

- And More -

Z80 Software Gourmet Guide & Cookbook

You need this cookbook!

You'll be able to put together programs without having to start from scratch. You'll have the most useful routines at your command — already programmed and ready-to-use. You'll get a plain-talk explanation of how the powerful Z80 instruction set works. And that's a big value to everyone, Z80 owner or not!

Why is it called a cookbook?

Because it's a book of recipes. It contains routines, subroutines and short programs. These are the ingredients. All you do is take a pinch of this, a pinch of that. Combine the ingredients, and voila — your own masterpiece! Just the program to suit your taste.

Time tested recipes.

Check These Features

- *Handy reference to Z80 instruction set*
- *Search and sort routines*
- *Many general purpose utility routines*
- *Flow charts and source listings*
- *I/O and interrupt programming*
- *Machine codes given in both hexadecimal and octal notation*
- *How to control and manipulate Z80 stack*
- *Code and numeric conversion routines*

Although the Z80 cookbook is brand new, SCELBI's software cookbook idea has been around for years. The recipes are really time tested! Tens of thousands of our 6800 and 8080 cookbooks have been used throughout the U.S. and in countries around the world. Add the "Z80 Software Gourmet Guide & Cookbook" to your recipe filebox. Order today!

```

      YES! AUTOTYPE has a screen
      redimension command. The screen can
      be set from 16 characters wide to 120
      characters wide. There's even horizontal
      scrolling to view the text! Once more,
      we're far beyond the competition!

      CAN IT HANDLE TEXT LARGER
      THAN MY COMPUTERS MEMORY?

      YES! Most other Word Processors demand
      that the entire text be inside the
      computer. AUTOTYPE allows you to
      "spool" your text from the disk. This
      means that you can have edit files that
      are over 200 type written pages long!

      CAN IT UNDERLINE?
      CAN IT BOLD-FACE?
      CAN IT INDENT?
      CAN IT HYPHENATE?

      YES! YES! YES! YES! AUTOTYPE
      has ALL the standard Word Processor
      features including underlining text,
      boldface printing and paragraph
      indentation. AUTOTYPE also has soft
      and hard hyphens. Soft hyphens are
      used at the end of lines and disappear
      if moved.

      WHAT ABOUT INSERTING IN THE
      MIDDLE OF A WORD?

      Certainly! AUTOTYPE allows inserting
      anything anywhere! You can move
      single letters or entire chapters right
      into the middle of any word. Now
      THAT'S POWER!

      WHAT ABOUT INSERTING IN THE
      MIDDLE OF A WORD?

      Certainly! AUTOTYPE allows inserting
      anything anywhere! You can move
      single letters or entire chapters right
      into the middle of any word. Now
      THAT'S POWER!
    
```

```

      YES! AUTOTYPE has a screen
      redimension command. The screen can
      be set from 16 characters wide to 120
      characters wide. There's even horizontal
      scrolling to view the text! Once more,
      we're far beyond the competition!

      CAN IT HANDLE TEXT LARGER
      THAN MY COMPUTERS MEMORY?

      YES! Most other Word Processors demand
      that the entire text be inside the
      computer. AUTOTYPE allows you to
      "spool" your text from the disk. This
      means that you can have edit files that
      are over 200 type written pages long!

      CAN IT UNDERLINE?
      CAN IT BOLD-FACE?
      CAN IT INDENT?
      CAN IT HYPHENATE?

      YES! YES! YES! YES! AUTOTYPE
      has ALL the standard Word Processor
      features including underlining text,
      boldface printing and paragraph
      indentation. AUTOTYPE also has soft
      and hard hyphens. Soft hyphens are
      used at the end of lines and disappear
      if moved.

      WHAT ABOUT INSERTING IN THE
      MIDDLE OF A WORD?

      Certainly! AUTOTYPE allows inserting
      anything anywhere! You can move
      single letters or entire chapters right
      into the middle of any word. Now
      THAT'S POWER!
    
```

Word Processors are here. Just thumb through the pages of this magazine. There are at least five different companies selling them. So, which one's for you? How do you judge the differences? And what about cost. Are you willing to pay the 300 plus dollars that some of the companies are asking?

Well go ahead and compare! AUTOTYPE comes out ahead in EVERY category!

Features? AUTOTYPE has more powerful features than ANY other Word Processor on the market. But, don't take our word. Go ahead, compare! AUTOTYPE has an exclusive MACRO programming capability. No other Word Processor can make that claim. AUTOTYPE also has a scratch Holding Buffer. Again, no one else even comes close.

Price? AUTOTYPE beats 'em all! With a price tag of \$195, AUTOTYPE is well below the competition. But, again, don't just take our word. Go ahead, look for yourself. Then fill out the order form below to start processing words instead of using a word processor!

CAN I MOVE PARAGRAPHS AROUND?

YES! AUTOTYPE has a Holding Buffer that can be used to save any amount of text and then Unhold it to the location you want. AUTOTYPE even allows you to do multiple Unholds!

CAN I MERGE CUSTOMERS NAMES INTO LETTERS?

YES! AUTOTYPE contains a "merge" character that may be placed anywhere in text. Then, at the time text is printed, a separate file may be merged into the letter and then printed! Another feature that NO OTHER WORD PROCESSOR has!

CAN I ENTER TEXT IN SOME OTHER FORMAT THAN 64 CHARACTERS WIDE?

YES! AUTOTYPE has a screen redimension command. The screen can be set from 16 characters wide to 120 characters wide. There's even horizontal scrolling to view the text! Once more, we're far beyond the competition!

CAN IT HANDLE TEXT LARGER THAN MY COMPUTERS MEMORY?

YES! Most other Word Processors demand that the entire text be inside the computer. AUTOTYPE allows you to "spool" your text from the disk. This means that you can have edit files that are over 200 type written pages long!

CAN IT UNDERLINE? CAN IT BOLD-FACE? CAN IT INDENT? CAN IT HYPHENATE?

YES! YES! YES! YES! AUTOTYPE has ALL the standard Word Processor features including underlining text, boldface printing and paragraph indentation. AUTOTYPE also has soft and hard hyphens. Soft hyphens are used at the end of lines and disappear if moved.

WHAT ABOUT INSERTING IN THE MIDDLE OF A WORD?

Certainly! AUTOTYPE allows inserting anything anywhere! You can move single letters or entire chapters right into the middle of any word. Now THAT'S POWER!

CAN IT SEARCH AND REPLACE?

YES! But, there's more! AUTOTYPE allows simple searches of search and replace. AUTOTYPE also allows wild card characters in the search string for probable matching! A very simple feature that AUTOTYPE makes very powerful!

CAN IT DO AUTOMATIC PAGE NUMBERING AND TITLING?

Of Course! Any length title up to the current line length. Page numbers can start anywhere. And if that's not enough, the number of blank lines below the title is adjustable!

DOES IT HAVE "DYNAMIC" PRINT FORMATTING?

OH YES! And with a flare! The pages that you see printed here were all printed from the same file. Only the print MACRO was altered! What's more, they were all printed on a standard serial printer. Complete "dynamic" print formatting can be accomplished with NO alteration of text!! Let's see the competition make that claim!

CAN IT DO SUBSCRIPTS AND SUPERSSCRIPTS?

YES! Once again, AUTOTYPE has the features to be called a true processor of words and not just another word processor.

CAN IT VERTICAL TAB?

YES! And do negative vertical tabs to the top of page also! This is invaluable for two column printing.

CAN YOU ADJUST THE INDENT, LINE LENGTH AND JUSTIFICATION?

COMPLETELY! Either in the text itself, by manual formatting commands or with a print MACRO. Only AUTOTYPE gives you that kind of choice!

WILL IT EXECUTE A SERIES OF COMMANDS AUTOMATICALLY?

YES! That's one of AUTOTYPE's standard features. No other Word Processor has the ease of use or the powerful commands that AUTOTYPE has.

ARE THE TABS ADJUSTABLE?

All tab stops are displayed graphically with a simple command. Tab removal and setting are simple cursor movements and a single key command! No more "guessing" where your tabs are set. They're all laid out in front of you!

HOW MUCH DOES AUTOTYPE COST?

\$195. This question is the easiest to answer. It's simple. We want you to use your computer to its fullest extent. And we want you to be able to do it at a reasonable price. This is the one area where our competition is way ahead of us! They simply charge more than we do!

HOW DO I ORDER?

We thought you'd never ask! Just fill out the order form below and mail to INFINITY MICRO. Or call us directly and place your order. It'll be shipped the same day.

Build your own microcomputer as you learn computer technology at home.

New from NRI! The Most Complete and Up-to-date Home Study Course Ever Offered

As the microprocessor revolutionizes the computer world and microcomputers appear almost everywhere, NRI brings you a new, convenient, and effective way to keep up with this expanding technology. It's NRI's Computer Technology Course, created and designed exclusively for learning at home in your spare time.

Featuring NRI's Exclusive Dual Language Microcomputer

NRI goes beyond book learning to give you practical, "hands-on" experience in designing circuitry, interfacing components, programming, and troubleshooting. As you learn, you actually assemble NRI's designed-for-learning microcomputer, incorporating the latest advances in the state of the art. It looks and operates like the finest of its kind, actually does more than many commercial units. But NRI engineers have designed components and planned assembly so it demonstrates important principles, gives you working experience in detecting and correcting problems. And it's yours to keep, put to work in your own home or business.

You also build and keep your own test instruments, including a transistorized volt-ohm meter and CMOS digital frequency counter. And NRI's Discovery Lab[®] broadens your horizons with specialized experiments and theory demonstrations.

The Proven Way to Learn at Home

You don't have to worry with travel, classes, or time lost from work when you learn the NRI way. As they have for more than 60

years of teaching technical subjects, NRI brings the material to you. You study in your spare time, at your convenience, using "bite-size" lessons that program material into logical segments for easier assimilation. You perform experiments and build equipment using kits we supply. And your personal NRI instructor is always available for consultation should you have questions or problems. Over a million students have already shown the effectiveness of NRI training.

Choice of Courses

Several courses are available, depending

upon your needs and background. NRI's Master Course in Computer Technology starts with the fundamentals, explores basic electronics and digital theory, the total computer world, and the microcomputer. The Advanced Course, for students already versed in electronics and general computers, concentrates on the microprocessor and microcomputer. In both courses, you build all instruments and your own computer.

Send for Free Catalog... No Salesman Will Call

Get the details on these exciting new courses in NRI's free, 100-page catalog. Shows all kits and equipment, lesson outlines, and full information, including facts on other electronics courses. Mail the coupon today and we'll rush your catalog. No salesman will ever call. Keep up with the latest technology as you learn on your own computer. If coupon has been removed, write to NRI Schools, Computer Department, 3939 Wisconsin Ave., Washington, D.C. 20016.

EASYWRITER,* the 1st true Word Processor for the Apple!*

Are you looking for the best Word Processor for your Apple? Well we are so sure you'll choose **EasyWriter** that we've prepared this ad to help you make your decision **EASY**. Check out these powerful features:

- Incremental spacing to support your Qume, Diablo, or Spinwriter
- Character oriented (No line numbers to deal with)
- Menu selectable routines for all known printers and interfaces
- Word wrap around on screen for continual text entry
- Our own new high speed DOS (Twice as fast as Apple's)
- Of course full editing, disk, and printer commands
- Subscripting, Superscripting, and MORE MORE MORE . . .

The straight facts make EasyWriter the only logical choice. By the same people who brought you WHATSIT. Available at your local computer store or our new California office!

A User's Look at Tiny-c

Christopher O Kern
201 I St SW Apt V-839
Washington DC 20024

As the microcomputer industry has responded to a rapidly growing market — a market composed of small business users and others who are less interested in computers than they are in *using* computers for particular applications — a considerable amount of good system-level software has become available. Unfortunately, any given computer hobbyist is able to use only a small portion of this software.

It is inevitable that the microprocessor that is chosen to be the central processing unit of a small computer will restrict the range of avail-

able software to the subset written for that microprocessor. But for the vast majority of computer hobbyists, there are two other impediments to using the system programs that are now on the market (assemblers, text editors and processors, language interpreters and compilers, and the like) that are far more important. First, available programs often require large amounts of memory and floppy disk storage; second, almost all of the software on the market requires that the user have a particular manufacturer's computer or, at the very least, a particular disk operating

system.

There is a simple way around these two restrictions. The software vendor can sell his product as source code for particular microprocessors, with directions for adapting the program to the end user's computer system. Given the economic pressures of the software market, this has not proved to be a popular approach. However, an intriguing experiment in selling a sophisticated system program on this basis is being carried out by tiny-c associates (the lower-case style is theirs). This program offers an interpreter (for an exceedingly modest price) for the structured programming language *tiny-c* that can be easily adapted to any 8080-family or LSI-11/PDP-11 computer.

Tiny-c is based on the C programming language, which was developed at Bell Laboratories, where it was used to write the UNIX operating system under which the C compiler can be run. As might be expected of a programming language that can be used to write operating systems, C mirrors the actual operation of a computer somewhat more closely than does a language like BASIC. Tiny-c follows C's example in this respect, as well as most others. For those familiar with C (I was not at the time I started using tiny-c on my home computer), I should point out that tiny-c is not a true subset of C. There are slight syntactical differences, and tiny-c has a comparatively restricted set of statements, fundamental data structures, and operators.

Tiny-c follows C's example in another way: a significant portion of the tiny-c language system is written in tiny-c itself. The actual interpreting of tiny-c code is done by a program that is written in 8080 or PDP-11 assembly language. But tiny-c pro-

THE TRS-80* BLUES.

Do your TRS 80'S limitations hit a sour note? Our full line of business-oriented software can change that tune.

They're easy to use, modularly designed, and superiorly documented, giving you versatility and sophistication of a higher scale, at a price you'll sing about.

So write us, and we'll send you the score.

SMALL BUSINESS SYSTEMS GROUP

*Suggested retail price.
Substantial OEM and dealer
discounts available

You can't buy more
capability for less . . . But
you can buy less for more.

MPI presents the perfect answer to your inflation-riddled printer budget. THE MODEL 88T DOT MATRIX PRINTER. The first in a series of new full-capability low-cost printers designed specifically for the general use computer market. The Model 88T is a fully featured printer with a dual tractor/pressure-roll paper feed system and a serial or parallel interface. The tractor paper feed system provides the precision required to handle multi copy fanfold forms, ranging in width from 1 inch to 9.5 inches. For those applications where paper costs are important, the pressure-roll feed can be used with 8.5 inch roll paper. A long-life ribbon cartridge gives crisp, clean print without messy ribbon changing. The microprocessor controlled interface has 80, 96 or 132 column formatting capability while printing upper and lower case characters bi-directionally at 100 characters per second.

With all of these features, **plus** quality construction, continuous duty print head and attractive styling, the Model 88T would easily sell at the competition's "under \$1000" (999.⁹⁹) tag. But we are offering it for only \$749; this should make you happy and several hundred dollars richer.

Write for complete specifications and pricing information.

MICRO PERIPHERALS, INC. 2099 WEST 2200 SOUTH / SALT LAKE CITY, UTAH 84119 / (801) 973-6053

grams are written, edited, and (in most cases) run under the supervision of a *program preparation system* that is written entirely in tiny-c. The importance of this should not be underestimated. It means that it is easy to change the way the user interacts with the tiny-c system by writing a new program preparation system in tiny-c. This new program preparation system can be tested and debugged

under the old version. While any changes in the way tiny-c programs are interpreted would have to be made as alterations to the assembly language code, the type of customizing that most users will probably be interested in can be done without re-assembly. For the truly ambitious, the source code for the interpreter is available for alteration, substitution, or just general tinkering.

The Language

Before looking at the system in more detail, a description of the language is in order. Tiny-c is quite unlike BASIC. There are no line numbers. Variables can have names of any length (although only the first seven and last one letters of a variable or function name are actually used by the interpreter). Control flow is not limited to a sequence of individual

Tiny-c Program Example

Listing 1 is a tiny-c function to fill a buffer with ASCII text, such as might be required in a text processing program. The program fragment illustrates a number of features of tiny-c.

Buffer, cursor, and blockend are all global variables, which must be declared outside any function. Buffer is a pointer to an address in computer memory representing the start of the buffer. Cursor is a pointer to the address of the next byte of text to be printed. Blockend is a pointer to the address following the last byte of text that has been read from an external file; new text will be placed beginning at blockend.

The first two lines of the function declare local variables. Recordcount is an integer variable. Pointer is a character pointer, which will later be set to an address within the buffer. The byte it will point to is pointer(0).

In the third line of the function, a standard library function called movebl is called. Movebl will shift any text that is left over from the previous file record to the start of the buffer. Its arguments are a pointer to the first character to be moved, a pointer to the last character to be moved, and the distance to move the block (in this case, the negative distance represented by buffer-cursor).

Once the leftover text has been moved, the cursor and blockend pointers must be reset. The blockend pointer is moved back the same distance that the entire block was moved. In the same statement, the local pointer is set to the same address. Accomplishing the same setback, but somewhat more simply, the

address of cursor is assigned the address of the start of the buffer.

The parentheses in the sixth line of the function set the order of evaluation inside the condition of the if statement. First, another standard library function, fread, is called to read a new record from the file. Fread's arguments are a pointer to the address showing where to place the new text (blockend), and a unit number designating the mass storage device. Fread returns the number of bytes

the new text. Then a while loop is used to excise any carriage returns in the text (tiny-c files as implemented in my system do not contain separate line feeds). Note how the byte pointer(0) can be evaluated as either an ASCII integer code (13 = carriage return) or a character (' ', or blank). Note also how the local pointer is incremented through the new text. When it reaches the address of blockend, the while condition fails and the loop is terminated. As it so

```
fillbuffer [
    int recordcount
    char pointer(0)
    movebl (cursor, blockend, (buffer - cursor))
    pointer = blockend + blockend + (buffer - cursor)
    cursor = buffer
    if ((recordcount = fread (blockend, 1)) > 0) [
        blockend = blockend + recordcount
        while (pointer < blockend) [
            if (pointer(0) = 13) pointer(0) = ' '
            pointer = pointer + 1
        ]
    ]
    return recordcount
]
```

Listing 1

actually read, if any, or a negative number indicating that the end of the file has been reached (the end-of-file record, by convention, contains no data). The local variable recordcount is set to the number of bytes read.

The statement subject to the if condition, enclosed in brackets, will be executed only if recordcount is positive (ie: if the record read contains new text). If it is, the condition is fulfilled and the code that is enclosed in the brackets is executed. First the blockend pointer is moved up to the end of

happens, this is also the end of the if statement, hence the two successive closing brackets.

Now all that is left is to return control to the calling function. The return statement is entirely optional; one final bracket will do the job. But the calling function may need to know how many bytes have been placed in the buffer, so recordcount is returned. Recordcount becomes the numerical value of the function fillbuffer to the calling function. Fillbuffer could therefore be used to represent an integer in some tiny-c expression.

What's NEW

from

SOFTAPE

RACER

Slip behind the wheel, ignite the engine and get ready for a high speed race. RACER uses Hires and paddles to simulate Grand Prix excitement. Requires 24K.

CRAZY 8's

Crazy 8's is a card game using Bill Depew's HIRES playing cards. One player can play the APPLE. The beginner can select the option of seeing the APPLE's hand while playing.

Crazy 8's is an easy to learn card game. Great for all ages. Requires 24K.

MICROGAMMON 1.0

Pit your mental skill and luck against that of the Apple with this computer implemented version of the popular board game Backgammon. All the moves are displayed on the video screen along with the board layout and pieces.

This program requires at least 16K of memory to run from cassette and 32K of memory to be stored and played from an Apple II Disk System. No additional hardware is needed.

Learn, practice, and enhance your Backgammon ability a true competitor. (To our knowledge, the Apple doesn't cheat!!!)

SOLITAIRE POKER

The ultimate poker machine! SOLITAIRE POKER simulates the poker machines that line the Las Vegas strip. Practice your poker ability with Hires playing cards. SOLITAIRE POKER is a sure winner! Requires 24K.

Two More By Steve Baker

GOMOKU

The ancient game of five men in a row. You play against a machine language routine with three levels of excellence. A Hires board using SCREEN MACHINE gives this game the beauty and style of chess. Requires 16K.

FIGHTER PILOT

It's war, and your mother ship is under attack. The adrenalin flows as you accelerate through the launch tube and penetrate the void of space. With all systems operating, your sensors show the direction of the enemy racing to meet you. After a few bursts he explodes, and you fly through his debris to meet the next one.

FIGHTER PILOT is a fast-moving game of excitement and skill. This graphics program, written in integer basic, requires 16K of memory.

Circle 357 on inquiry card.

ROULETTE

Roulette is a realistic duplication of the popular casino favorite using HIRES graphics and a spinning wheel. Bets can be placed with the keyboard or you can use SOFTAPE's BRIGHT Pen. One or two players can bet against the house. Requires 24K.

CRAPS

Play Las Vegas Craps on a high resolution playing table created by your APPLE. Place bets, play the field, passline and hardway rolls... all are possible with this detailed simulation. Dice rolls are animated on the screen. Improve your game or devise your own "system". Craps requires INTEGER BASIC and 24K or memory. BONUS!! Included on the back side of the tape is Bright Pen™ Craps for those lucky guys with the SOFTAPE Bright Pen. You will be amazed how easily moves are made and how fast the game progresses!!

PRO GOLF

Now, even on rainy days, you can improve your game with PRO GOLF. With the Apple II as your caddy, you choose your own clubs and irons on each shot on this full 18-hole course. Every fairway has its own challenging sandtraps and water hazards, but distractions disappear when the screen displays only the green as you begin to putt. Your Apple-caddy keeps track of your score. Have fun, and remember... keep you eye on the ball!

statements, as is the case in BASIC, but includes the invocation of functions (the equivalent in this context to BASIC subroutines), either through explicit calls to a given function, or by using the function as an element in a more complex tiny-c expression.

All tiny-c programs are composed of functions. Tiny-c functions, in turn, are composed of other functions, tiny-c statements, and operators. The list of tiny-c statements is small but surprisingly flexible. It includes *if*, *if-else*, *while*, *return* (which provides an optional way for returning some computed value of a function to the calling function), and *break* (which terminates the innermost current *while* loop prematurely, ie: without waiting for the normal termination condition to be met).

There is no explicit "do" statement. Tiny-c functions are called directly by simply placing their names in the program text. They are invoked indirectly by their use as elements in a larger tiny-c expression. Within a logical expression, tiny-c functions take on whatever value the function returns,

although a function is not required to return any value at all (the default is zero). A series of function calls, or any other series of tiny-c statements, can be turned into a compound statement and executed as a unit by enclosing it in brackets.

Tiny-c operators include unary minus (-), multiplication (*), integer division (/), remainder following division (%), addition (+), subtraction (-), less than (<), greater than (>), less than or equal (<=), equal (=), not equal (!=), greater than or equal (>=), and assignment (=). Choosing the *single* equal (=) sign for assignment and the *double* equal (==) for testing equality may seem rather odd at first, as does the choice of !=, instead of the more common <>, as the inequality operator. In practice, both choices are easy to adapt to and soon become intuitive.

The number of primitive tiny-c data structures, like the number of statements and operators, has been kept to a minimum. There are two fundamental types of data in tiny-c: 16-bit signed *integers* (which permits numbers from -32768 to 32767), and

8-bit *characters* (which can actually represent any 8-bit quantity). These two basic structures can be combined into arrays, but tiny-c does not provide any way to deal with arrays as a single entity; this must be done with functions. You cannot, for example, write [if (answer == "Yes") then startgameover] in tiny-c because the character array "Yes" cannot be compared with anything using the equality operator. Instead you must write a function to perform a letter by letter comparison.

In addition to integers, characters, integer arrays, and character arrays, more complex data structures representing any combination of the fundamental structures can be created. On the other hand, tiny-c does not provide services to create or process these more complex data structures in the manner of the Pascal language. These must be developed and accessed by specific functions through the use of pointers, which provide an essentially convenient but rather low-level way of searching through memory.

Pointers are declared in tiny-c

What you 'C' is what you get!

C Compiler for CP/M*

New, and available now! An easily affordable compiler incorporating most of the features of the full C language.

BD SOFTWARE

System requirements: CP/M and at least 24K of RAM

Variable Types: char, int, unsigned

Composite Types: arrays, structures, unions

Pointers: to variables, structures, unions and functions

Features: is a structured language, all functions (Programs) recursive; more powerful expression operators than any other von Neuman type language; allows free-formatted source; close enough to UNIX**C to make conversions feasible.

Speed: On 2 MHz 8080, the statement for (i = 1; i < 30000; i++) x = 5; takes about 4 seconds to execute.

Package contains: compiler, linker, library manager; standard function library; sample source files include games, a terminal emulator with disk I/O plus the source for many standard library functions; BDS C User's Guide; Book—*The C Programming Language* by Dennis Ritchie and Brian Kernighan of Bell Labs.

Price: \$110

Recipient of the Computer Lib Seal of Approval

Pascal/M™

DIGITAL MARKETING announces CP/M* compatible Pascal. Pascal/M brings the language power of Pascal together with the extensive file handling capabilities of CP/M.

- Pascal/M allows the user to have full access to CP/M data files written in other languages (such as BASIC) and stored under CP/M.
- All CP/M utilities are available for managing Pascal Programs.
- All I/O is fully compatible with CP/M file structure.
- Built-in procedures provide for terminal-independent cursor controls.
- Standard Pascal/M is available for the 8080/85 or Z80 CPUs.
- A special Z80 version takes advantage of the Z80's extended instruction set.

This package includes diskette with P Code Compiler, Interpreter, and Runtime Library; *Pascal User Manual and Report* by Jensen and Wirth; and *Pascal/M User's Reference Manual*. Pascal is available on 5 1/4" or 8" diskettes. The cost is \$350. For manuals only - \$35. • Visa/MC.

*CP/M is a trademark of Digital Research.

through the declaration of an array. An array is declared by declaring its *type* (integer or character) and its *last element*. All arrays begin with element 0, so the tiny-c declaration [int arrayofintegers(10)] creates an 11-element array of integers (2-byte values), and the declaration [char arrayofcharacters(10)] creates an 11-element array of single-byte values.

In either case, the pointer is simply the array name without a subscript. Therefore, the above integer declaration has simultaneously declared a pointer, arrayofintegers, which can be aimed at the start of any 2-byte value in the array by moving it, through a tiny-c expression, in 2-byte increments. The pointer, which is aimed at the zeroth element of the array at the time of declaration, can therefore be moved to the third element (the start of the third 2-byte integer) by setting [arrayofintegers = arrayofintegers + 3] without any requirement of capturing the data in the intervening two elements of the array. Similarly, the pointer arrayofcharacters can be moved in

1-byte increments. There is no way to declare a pointer without declaring at least one element of an array, so when the array itself is not needed (eg: when the pointer is going to be used to keep track of data in a pre-existing array such as a buffer), the tiny-c convention is to declare an array whose last element is 0.

This ability to declare pointers and move them around at will makes it possible to use tiny-c pointers to address any location in the computer's available memory. The addressing is, of course, relative to where the tiny-c interpreter decides to locate the first element of the array, but with a few lines of assembly language code it is possible to add the absolute addressing that many BASIC interpreters provide through PEEK and POKE commands.

Tiny-c is quite permissive about interchanging integer and character data, thus permitting reference to characters by their numerical ASCII codes. It also provides a powerful facility for generating interesting and often complex program bugs.

It should be fairly obvious that

tiny-c is not a very sophisticated language, and there are certainly features that I miss. Boolean operators would be handy, as would multiple-precision integer and floating-point arithmetic. I don't particularly miss the rather wide variety of mathematical functions that are provided as part of my BASIC interpreter, and I can duplicate the very useful string-handling functions that are available in BASIC by either writing them in tiny-c or by adding machine language subroutines to the tiny-c system as described below.

The most important feature of tiny-c is one that is essentially unavailable in BASIC. This feature is the ability to create functions and then use or manipulate them without further thought as to what is inside. Tiny-c functions exist as independent worlds of their own. They have their own local variables, although it is also possible to define global variables and have all functions access them. They can accept arguments and manipulate them within the function, without changing the value that was passed by the calling function. In

NOW — GET EVERYTHING YOU NEED (hardware and software) TO ADD SOUND TO YOUR BASIC PROGRAMS!

Computer games without sound effects are like TV shows without audio — flat. Now you can add the joy of sound to your entire BASIC library. Soundware™ gives you everything you need!

You get hardware — a neat speaker-amplifier unit with volume control, earphone jack and connectors. No wiring, no soldering — simply add two AA batteries and plug it in!

You get software — two programs to demonstrate and help you create your own sound effects. Make your programs come alive — add laser sounds, bird calls, bounces, clicks, sirens, music notes, tunes! Complete instructions included, one-year limited warranty, immediate shipment.

GREAT CHRISTMAS GIFT
See your dealer for demonstrations.

fact, a tiny-c function is *not* able to change the value of a variable that is passed to it (except internally) *unless* an express provision is made.

This reliance on functions as fundamental building blocks of programs has three important consequences:

- Programs are easy to read. They are not only modular, but because control flow is altered only by the invocation of other tiny-c functions or the intervention of a few simple tiny-c statements, it is easy to follow what the program is doing. Combining this with the availability of long, descriptive variable and function names makes it possible to read tiny-c programs in a way that is almost as close to reading English text as it is to reading a program written in BASIC or FORTRAN.

- Programs are easy to alter. Since functions are atomic units as far as other functions are concerned, it is possible to change or substitute a function without worrying about unanticipated effects of the change on other parts of the program. Obviously, it is not possible to change a data structure used by other functions without ill effects, or blithely alter global variables (which are therefore best kept to a minimum). It is possible to rewrite a function to make it more efficient or to add a strictly local feature without resulting in the blow-up of some other function.

- Tiny-c functions can be kept in a library, taken out in the future, and used in new programs. With a little care, it is possible to write a function in a way that maximizes its generality and its future utility. In many instances, it is convenient to think of previously written tiny-c functions, not simply as potential components of new programs, but as extensions to the language. The program preparation system and the machine language interface provided in the tiny-c system encourage this, so perhaps it is time to describe the system in detail.

The System

The program preparation system and the machine language interface are two of the six main parts of the tiny-c system. The others are the interpreter itself, a library of commonly used tiny-c functions, a library of special purpose functions that have

been coded in machine language to increase execution speed, a set of input and output routines to service a console terminal and a mass storage device, which must be coded by the user for his own installation.

Everything except the I/O (input/output) routines is provided in source-code form (8080 or PDP-11 assembly language, or tiny-c) in the *tiny-c owners manual*, which is available from tiny-c associates, POB 269, Holmdel NJ 07733, and currently sells for \$40. The programs are also available on various machine-readable media in a number of formats. The one used by my computer, a Heath H8 with cassette mass storage, is not one of these, so I rather laboriously typed in the entire 8080 source code. Fortunately, the listings in the *tiny-c owner's manual* are quite legibly printed.

The interpreter is quite compact. Including the library of special functions that are coded in machine language and loaded along with it, the interpreter occupies a scant 4244 bytes in my system. There is no limitation on recursion (functions calling themselves, either directly or indirectly, where the function calls another function which calls the original calling function). But memory allocation is static. So, for example, a program that uses an unusually large number of active variables at one time might conceivably not run, even though plenty of extra memory was available in the section allocated for the program text. This would require that you stop the interpreter and reallocate memory. In practice, I have yet to have this happen. The internal operation of the interpreter is described in considerable detail in a chapter of the *tiny-c owner's manual*, which should facilitate making alterations.

I was slightly disappointed with the speed of execution of tiny-c. It is difficult to make comparisons with BASIC, mainly because the languages are so dissimilar, but also because my BASIC interpreter includes a large number of functions that speed up program execution considerably. Many of these functions, such as string handling functions, could be added to tiny-c as machine language subroutines, so any comparison that relies on the use of these special purpose BASIC functions is somewhat unfair. Still, when running through a

EUROMICRO 80

sixth symposium on microprocessing and microprogramming LONDON, September 16-18, 1980

1. CALL FOR PAPERS 2. CALL FOR MICE

EUROMICRO 80 is the sixth annual symposium organized by EUROMICRO, the European Association for microprocessing and microprogramming. EUROMICRO has held its previous conferences in Nice, Venice, Amsterdam, Munich and Goteborg. Workers in the fields of microprocessing and microprogramming have found these international events invaluable for getting together and exchanging ideas on the latest developments.

DEADLINES

Full Paper

Authors should submit six complete copies of their papers to the Programme Chairman, no later than January 31, 1980. The papers, (no longer than 16,000 words) should include a 200-word abstract and authors' names and mailing addresses.

Authors will be notified of acceptance by May 1, 1980; final camera-ready papers will be due on June 1, 1980.

Preprints of the Proceedings will be available at the time of the Symposium; the final Proceedings will be published later.

Short Notes

Authors should submit four copies of a 1000-word summary to the Deputy Programme Chairman before May 15, 1980; they will be notified of acceptance by June 30.

Final Short-Notes will be published in a Special Issue of the EUROMICRO Journal; camera-ready papers will be due at the Symposium.

FOR FULL DETAILS

In the U.S.: Contact Dr. Rodnay Zaks, **SYBEX**, 2020 Milvia Street, Berkeley, California 94704.

In Europe: Contact Prof. Lionel Thompson, **HSDE**, Hatfield AL 109LP England.

Industrial Seminars

Companies should submit two copies of a two-page summary, including title and the name of the person responsible for presenting the contribution, to the General Chairman before July 1, 1980.

They will be notified of acceptance by July 30. Industrial papers will be collected and handed out to participants at registration; they may be considered for later publication in EUROMICRO Journal.

EUROMOUSE CONTEST

A Micromouse contest, inspired by the IEEE event, will be held. Substantial prizes, trips, and other awards are available.

MICRO MOUSE

loop of simple variable assignments, tiny-c seemed to operate only a third as fast as my BASIC interpreter.

Functions in Machine Language

The machine language functions supplied with tiny-c perform a variety of tasks. One moves blocks of data around in memory, another counts the number of occurrences of a given character within a memory field, still others interface between tiny-c and the input/output routines supplied by the user. The user can add to this so-called "standard library" of machine language functions. Tiny-c provides several utility routines which are available to user-coded functions. These simplify the interface between tiny-c and machine language.

One thoughtful feature is a set of special calls to external subroutines which take place (if enabled) at the beginning of any program, at the start of every tiny-c statement within a program, and when the program finishes running. The manual suggests that these may be used to create

a *debugger*, which could allow you to single-step through a tiny-c program, set breakpoints, or enable a *profiler* which could count how often each statement is executed.

Functions in tiny-c

Aside from the standard library of machine language functions, there is a standard library of functions coded in tiny-c. These are normally loaded with the program preparation system. Like the machine language functions, this standard library of tiny-c functions is a mixed bag. Some just dress up machine language functions (which are called by number) with a descriptive name. Others convert from ASCII to binary and vice versa, read and write strings to the console terminal, and load and dump files. Continuing the parallel with the machine language functions, the user can add his own functions to the tiny-c library. This provides a convenient way to store functions that are used often at a given installation (eg: a function to drive a special device,

such as a digital plotter).

Program Preparation System

The program preparation system is the part of the tiny-c system that the user is most conscious of, because it mediates most interactions with the interpreter. As an editor, the program preparation system is quite adequate, but unexceptional. It provides commands for inserting text, moving a given number of lines up or down, locating a given line by number (tiny-c does not use line numbers, but the editor keeps count for its own purposes), locating a given string (the user may optionally specify whether the string being searched for is at the beginning or the end of a line), editing strings within a line, deleting lines, and reading and writing files (program text, plain text, or data). The one drawback to its being written in tiny-c is that the editor operates a bit slowly, but not so slowly as to be frustrating.

The program preparation system also permits you to execute any tiny-c function that is in the standard library or entered as program text. This means it is possible to run any program under the editor. For those who have floppy disks, that is not a particularly important advantage. For those, like myself, who depend on cassettes for mass storage, the freedom from having to shuttle programs in and out of memory is a big plus. The fact that the editor can be used to run a program also means that tiny-c, like BASIC, has a single operating environment. Programs can be written, tested, debugged, and run without the user having to consciously switch from one mode to another.

The program preparation system is entirely optional. It is provided in two forms. One is neatly formatted and commented, and occupies about 9000 bytes. The other is "crunched" — stripped of all of its unnecessary indentations and spaces. Because tiny-c is essentially free-form, this has no effect on program function. However, it renders the "crunched" code relatively unreadable. The saving is about 5000 bytes which, for a program that resides in memory for the amount of time that program preparation system does, is a fair trade for legibility.

Programs which do not use the

program preparation system (ie: those that operate directly under the interpreter) must begin execution with a function named "main." Other than that, any program that will operate under the program preparation system will operate directly under the interpreter, although the library functions normally loaded along with the program preparation system will probably have to be loaded with other programs.

By dispensing with the amenities provided by the program preparation system, a given system can run a tiny-c program that is roughly 5000 bytes longer than it could otherwise accept. With 24 K bytes of memory available on my system, I have approximately 8 K bytes of program space with everything loaded: the interpreter, a standard console driver, my I/O interface routines, and the program preparation system. One very useful improvement would be to provide text compression that would permit a series of spaces (which should be used liberally in a language like tiny-c for indenting) to be packed into a single byte. This, however, would require some changes to the interpreter.

Support Services

Before moving on to a brief description of the procedures for installing tiny-c, I should say a few words about the quality of the documentation and support for the tiny-c system. This is a rather low-priced item, but that fact is not reflected in the *tiny-c owner's manual*. The manual is slickly produced. As noted before, the quality of the printing is excellent. Comments in the assembly language code are a bit sparse, but the section on the internal operation of the interpreter explains each routine's purpose in acceptable detail. Since I was keystroking the entire source code anyway, I used the opportunity to merge in some of the documentation from the owner's manual text.

The manual provides a detailed description of the language, an operating guide to the program preparation system, several program examples along with comments on their style, the section on the internal operation of the interpreter, explicit installation instructions, and the various source codes. And it is written in coherent English.

Support is principally provided

through an occasional newsletter which provides fixes for program bugs, suggested improvements, and answers to commonly asked questions. When I found a minor bug in the way that the interpreter passed arguments between functions, my letter to tiny-c associates prompted a quick acknowledgement from author Tom Gibson, although he had no immediate solution.

Installation

As noted above, the user is required to code several installation

routines. These provide an interface between the computer's operating system and tiny-c. The routines write a single character to a console terminal, read a single character from the terminal, check to see if a character has been input, open files for reading from or writing to a mass storage device (such as a cassette recorder or floppy disk), read and write single records, and close files when the reading or writing is done.

Many of these functions are likely to be already available in the computer's operating system. In some

Cat Calls

How to tie your computer into the world.

All you need is a phone and a Cat™ acoustic modem. A Cat modem takes the data you type into your terminal and sends it out over standard telephone lines to any other compatible computer or terminal within reach of your phone. And it listens too.

So now you can work at home and talk by phone to your office computer. Gain access to data banks. Or swap programs with computer people

anywhere. The possibilities are endless—if you have Cat.

It's the fast, accurate, reliable modem that ties you into the world—for less than \$199.

cases, the tiny-c interface will consist of nothing more than juggling the data left in particular registers to match up the requirements of the tiny-c interpreter and the operating system. In other cases, certain functions of the operating system may have to be substantially adapted to meet the specifications set out in the *tiny-c owner's manual*. Some users may have to write all of the input and output routines from scratch.

The user has a lot of latitude in designing the interface. He can simply meet the minimum specifications in

the manual, or he can add features that will take advantage of the particular characteristics of his computer. In my case, I decided that I wanted to have a visual indication of all magnetic tape operations on the H8's front panel (a very useful feature of Heath's system). The interface provides that function on its own, without any intervention from the tiny-c interpreter.

While the installation instructions are quite explicit, coding the input and output routines is not a trivial task. Nevertheless, it should be well

within the competence of anyone with more than nominal experience in writing programs in assembly language, as long as the programmer is familiar with the internal functioning of the computer's operating system. A few "load and go" versions of tiny-c are available for specific computers, but many users will have to provide their own interface routines. While it may not seem like a particularly interesting chore, this is what gives tiny-c its generality, thus making it available for use on a large number of computer systems.

Once the interface routines are ready, the various components of the tiny-c system are loaded and linked. A program is provided in the manual for relocating the interpreter if the address supplied (hexadecimal 2000) is unacceptable. If you have typed in all of the source code, as I did, you can assemble the interpreter anywhere you want. Those users who buy machine-readable media can load the program preparation system as easily as the other parts of the system. In my case, the editor I used to enter the program preparation source code used a format that would have been indigestible to the tiny-c interpreter, so I had to write still another routine to reformat the file. Subsequent versions of the program preparation system are written under itself, so the problem only arose once.

I had a little trouble getting tiny-c up and running the first time, but all of the problems were my own. Most, as is usually the case, were the result of inattentive reading of the manual. They were all, fortunately, easy to correct. The entire project, from first reading of the manual through writing the interface routines through keystroking the source code through debugging, took most of my spare time for about three weeks.

There is something to be said for tackling a software project of this magnitude, even if most of the real work has been done by someone else. Although I would have undoubtedly bought tiny-c in machine-readable form if it had been available for my computer, the work I did during the installation gave me a much better understanding of the way the software works. That, in turn, has reduced the sense of intimidation that I have felt in dealing with programs that are this large and this complex. ■

FORT//80™

FORTRAN

for the 8080 only \$9995

- FORT//80 is a subset of Fortran IV with many powerful enhancements!
- FORT//80 is an advanced software development tool!
- FORT//80 is AFFORDABLE!!

FEATURES

- FORT//80 directly addresses 8080 ports as FORTRAN variables
- I/O drivers accessed via FORTRAN read/write statements
- FORT//80 accepts embedded in-line machine code
- 8080 condition codes are available as FORTRAN keywords and can be operated upon
- Multiple assignment operators accepted
- Interleaved listings and object code for quick debugging
- Symbolic names up to 31 char long simplify documentation
- Constants expressible to base 2, 8, 10, 16 or as char strings
- Compact; Needs only 25K for compiler and minimum workspace

- Fast; Runs up to 10 times as fast as PLM
- FORT//80 directives specify location of code in memory at run-time
- Interrupt and interrupt control
- FORT//80 control of interrupts and interrupt service lines
- All code runs on 8080, 8085 and Z80 (upward compatibility)
- FORT//80 is a true resident compiler and generates directly executable object code. No run time package needed
- FORT//80 is very fast. It compiles quickly and produces dense highly optimized code
- Single and double precision IBM format floating point arithmetic

PRICING

FORT//80 CPM version and manual on 8" diskette	\$99.95
FORT//80 Language manual separately	20.00
FORT//80 Implementation manual	20.00
Sample diskette validation program and data	5.00

Shipping charges to US and Canada postpaid, overseas add \$5.00. Please add appropriate state sales tax. Master Charge and Visa accepted.

1. FORT//80 is supplied on a single use basis, subject to the signing of a non-disclosure agreement.
2. FORT//80 can be implemented with other disc operating systems using the implementation manual or special versions available by quotation.
3. The purchase price of manuals and sample programs will be credited towards subsequent purchase of FORT//80.

Get Ready to Make Your Own Magic

announcement I. The first eight Personal Programs[®] from Aladdin Automation are waiting for you now at your neighborhood computer retailer or direct from Aladdin.

Now you can get your full share of Aladdin magic in every one of these Personal Programs[®]:

Math-Ter-Mind[®] A delightful, educational learning experience for your pre-school child. Watch the smile on your child's face as a correct answer makes the mathematician smile on the screen before you. A nursery song also serves as a reward for learning elementary addition and subtraction. With Aladdin's Math-Ter-Mind[®] your child's pathway to learning will be fun-filled . . . for both of you. Math-Ter-Mind[®]. The first release from the Aladdin Education[®] Series. (nursery song currently available only on Apple II[®] program)

Lunar Lander[®] In a controlled descent, you're just seconds away from your first landing on the cold, forbidding surface of the moon. As you navigate your delicate spacecraft downward to the safety of Moonbase, you must be ever watchful of the dangers rising to meet you with each passing moment: a fuel level fast approaching zero; deadly meteor showers that come from any direction, at any time; sheer-faced rock cliffs and rough terrain; choosing the correct landing pattern and rate of descent. Aladdin's Lunar Lander. Your chance to reach out and touch the stars . . . without leaving the safety and comfort of your own chair. The first release from the Aladdin Simulation[®] Series.

Craps[®] All eyes in the casino are on you. The dice are in your hands. Lady Luck sits at your shoulder, whispering . . . "Just one more time. Try your luck just one more time." You throw . . . and watch the dice tumbling on the screen. With Aladdin's Craps you play against the computer, so it's awfully tough to win. But when you do, it's an experience you're likely never to forget. Craps. An exciting, heart-pounding Personal Program[®]. The first release from the Aladdin Las Vegas[®] Series.

Mastermind[®] A challenging game of intrigue, centuries old, that will give you full chance to test your powers of logic, deduction and reason. And test them you will, as you try and solve the computer's puzzle, using clues as they're provided one-by-one. You control the degree of difficulty in this classic Personal Program[®] that offers one simple, yet all-consuming challenge: beat the Mastermind in a direct, one-on-one battle of wits. Aladdin's Mastermind. The first release from the Aladdin Old Favorites[®] Series.

Tic-Tac-Toe[®] Five different levels of difficulty allow a person of any age or skill to take part in this relaxing, enjoyable game that can act as a learning tool, as well. Level I, for example, is suitable for children and is excellent also for teaching simple mathematics. The computer plays just about perfectly at Level V. Just about, that is, so go ahead and take your best shot. See if you can beat the computer in this traditional favorite of young and old alike. Tic-Tac-Toe. Another first release from the Aladdin Old Favorites[®] Series.

Jungle Island[®] Shipwrecked in a raging storm at sea, miraculously you survive only to find yourself stranded on a seemingly deserted jungle island. Without food, water or supplies of any kind, you begin to try and find your way to safety. The computer will be your eyes and ears as you explore your jungle island and all the mysteries and dangers that lie in wait for you. Jungle Island[®]. A captivating first release from the Aladdin Adventure[®] Series.

Stix[®] Aladdin's Stix[®] can be played with 2 to 5 piles of sticks and between 1 and 19 sticks in each pile. The object: to be the one to pick up the last stick. Sounds simple? Yes, but you're playing against the computer. Take heart, though, because you can control the degree of difficulty in this update of the ancient game of Nim. Stix[®]. Another first release from the Aladdin Old Favorites[®] Series.

Super Pro Football[®] Here's your chance to be more than just an armchair quarterback. With Aladdin's Super Pro Football[®] you can replay any Super Bowl game, from the first, between Green Bay and Oakland, to last year's classic victory by Pittsburgh over Dallas. For once you can turn back the clock and go for that one big play that made the difference between victory and defeat in pro football's biggest game of all. Super Pro Football[®]. The first exciting release from the Aladdin Super Pro[®] Series.

Visit your neighborhood computer retailer or contact Aladdin direct to get your full share of the magic in Announcement I, the first eight Personal Programs[®] from Aladdin Automation.

Clubs and Newsletters

International Computer Chess Association (ICCA)

The ICCA prints two newsletters a year about ICCA planned activities, future events of interest to its members, reviews of books or articles, interesting anecdotes, and short technical papers. The ICCA is considering establishing an international archive for organizing and storing materials on computer chess, and would be interested in hearing from potential donors of funds and materials. Membership is \$10 for one year. For more information, write to Professor B Mittman, Editor, *ICCA Newsletter*, Vogelback Computing Ctr, Northwestern University, Evanston IL 60201.

Washington Apple Pi

Washington Apple Pi, a group of Apple II owners and users, meets at George Washington University, Room 206, Tompkins Hall, 23rd and H St NW, Washington DC at 9:30 AM the fourth Saturday of each month. The meetings include discussions of available software, classes on assembly language, demonstrations and explanations of home-built and commercially available hardware, and they have had a discussion of the Apple II in Europe from a visiting Belgian owner. The group also publishes a monthly newsletter. For more information, write Washington Apple Pi, POB 34511, Washington DC 20034.

Central Ohio Apple Computer Hobbyists (COACH)

Meetings are on the third Saturday of each month from 1 to 5 PM. For more information, contact Tom Mimplitch, 1547 Cunard Rd, Columbus OH 43227, or phone (614) 237-3380.

New Canadian Apple Users Group

The Apples British Columbia Computer Society, #101-2044 W Third Ave, Vancouver British Columbia CANADA V6J 1L5, meets on the first Wednesday of every month. Dues are \$15 per year.

REDUCE Newsletter

The Symbolic Computation Group of the University of Utah publishes a quarterly newsletter devoted to REDUCE, a LISP-based computer algebra system

designed for a variety of large computers. The newsletter is available from the University of Utah computer science department for \$100. For more information, contact the Department of Computer Science, University of Utah, Salt Lake City UT 84112.

Heath Users Group (HUG)

HUG Northshore is a computer club for Heathkit computer users (H8, H11, ET3400). The club provides a forum for exchanging ideas, programs and knowledge, with the intent of developing the full potential of the computer system. The club meets the second Wednesday of each month at 7 PM at the following address: Hill Tech Building, 88 Holten St, Danvers MA 01923. For a free copy of their monthly newsletter, write HUG Northshore, POB 112, Danvers MA 01923.

NEVADA COBOL™ + PTDOS* = FAST! FAST! FAST!

NEVADA COBOL™ COMPILER

FAST COMPILE TIME Up to 650 lines per minute on a 32K RAM Sol-20/HELIOS*.

FAST RUN TIME The compiler generates efficient in-line machine language.

FAST DEVELOPMENT TIME COBOL was designed specifically to solve business problems. NEVADA COBOL™ is easy to learn & simple to use.

FEATURES Random access file support
Sequential files both fixed and variable length
Debugging capability
Copy statement
Data types: Character string, 16-bit binary and packed decimal (COMP-3)
18-digit accuracy
Hexidecimal non-numeric literals
Powerful editing with English language error messages
Interactive ACCEPT/DISPLAY
Subset of ANSI-74

WANT A CLOSER LOOK? SEND \$25 FOR THE NEVADA COBOL MANUAL AND \$275 FOR THE PTDOS/HELIOS DISKETTE.

COBOL APPLICATION PACKAGES

BUDGET PLANNING The Business Plan Generator consists of 2 COBOL programs. One is interactive menu driven for data collection and the other prints professional style reports. Both are table driven for ease in changing chart-of-accounts. Fantastic time saver and planning aid for start-up or existing businesses.

PRECOCOL The COBOL preprocessor allows the COBOL programmer to make up his own time saving mnemonics which are translated to standard COBOL reserved or user words. Old or new programs are margin aligned and structure indented for easy reading, changing or debugging.

PFR Personal Financial Reporting consists of 3 COBOL programs to record and print personal income and expenditures. The heart of the system is the easy data collection forms and interactive input program. Report shows current month, year-to-date and average figures.

LABELS Prints labels 1-up or 4-up cheshire or gummed format, and the 1-up has an option to stop for envelope feeding.

SEND \$25 FOR EACH APPLICATION PACKAGE WHICH INCLUDES THE DOCUMENTATION AND EITHER THE SOURCE CODE LISTINGS OR PTDOS/HELIOS DISKETTE. PLEASE INDICATE YOUR PREFERENCE.

Introducing

COMPUTER SHOPPER, the first complete publication listing business, commercial and personal computer equipment is coming this fall with the type of information you can use every month.

Just \$5 brings you a full year of late breaking ads for available equipment, software and accessories for mini, micro and big system computers AND you can run **YOUR FIRST CLASSIFIED AD WITHOUT CHARGE** under this Charter Subscription offer.

EACH ISSUE OF COMPUTER SHOPPER GIVES YOU:

- Ads from individuals, brokers and manufacturers, nationwide
- Categorized ads so you can find them instantly
- Large 11 by 14 easy-to-read format
- Low classified ad rates - 10¢ a word
- Short turn-around advertising time — your ad is in print in 10 days
- Free ad typesetting
- Nationwide circulation guaranteed

COMPUTER SHOPPER is **YOUR** place to buy or sell any computer equipment because it has been designed after extensive research into the needs and wants of America's computer buyers and sellers.

To reach more than 20,000 computer-owning firms each month, COMPUTER SHOPPER has been launched on a \$78,000 budget by Patch Publications, a proven specialist in reader service

advertising, including its flagship photographic publication, **Shutterbug Ads.**

Using in-house computer facilities and professional typesetting, Patch's experienced production team makes COMPUTER SHOPPER easily affordable for firms and individuals by using modern techniques and large-space advertising to offset normal costs.

EVEN A LIMITED-TIME COMPUTER USER can get any buy, sell or want-to-find message into this nationwide market for a most reasonable cost. . . only 10¢ a word.

And to prove how successful this ad can be for you, this Charter Subscription Offer includes your own **complimentary** classified ad. Use it to sell your used equipment or to find components you need.

Just select the correct category listed at left, include it, plus your ad wording on a separate sheet. . . then return it with your subscription acceptance.

DON'T MISS a single timely issue of COMPUTER SHOPPER. Send the coupon with your ad today, knowing you can cancel anytime and receive a 100% refund for all unmailed issues.

CP/M® SOFTWARE TOOLS

NEW ED-80 TEXT EDITOR

ED-80 offers a refreshing new approach for the creation and editing of program and data files conversationally — and it saves you money. Its powerful editing capabilities will satisfy the most demanding professional — yet it can still be easily used by the inexperienced beginner.

Look at These Outstanding Features:

- FULL SCREEN window displays with forward and backward scrolling for editing your data a page-at-a-time, rather than line-by-line.
- Provides you with all the features found on the large main-frame and minicomputer editors, such as IBM, UNIVAC, CDC, and DEC.
- Commands include forward or backward LOCATE, CHANGE, and FIND; and INSERT, DELETE, REPLACE, APPEND, SAVE, PRINT, WINDOW, MACRO, TABSET, SCALE, DUMP, and others.
- Compatible with existing CP/M edit and text formatted files, with CBASIC, and with Microsoft's MBASIC, FORTRAN, COBOL, and ASSEMBLER.
- CHANGE commands allow you to make conditional changes and to use variable length strings.
- Designed for CP/M and derivative operating systems, including LIFEBOAT, CDOS, IMDOS, DOS-A, ADOS, etc.
- GET and PUT commands for concatenating, moving, duplicating, and merging your edit files on the same or different diskettes.
- Provides you with fast memory-to-memory COPY commands, and an intermediate buffer for copying lines over-and-over.
- Repays your initial investment many times over with unique time-saving editing capabilities.
- Saves your last LOCATE, CHANGE, FIND, and APPEND command for easy re-execution.
- Simple line-oriented commands for character string editing.
- Automatically displays the results of every edit command for your verification.
- Single keystrokes for your most commonly used commands.
- Safeguards to prevent catastrophic user errors that result in the loss of your edit file.
- INLINE command for your character-oriented editing.
- Designed for today's high speed CRT's, video monitors, and teletypewriter terminals.
- Thoroughly field tested and documented with a comprehensive User's Manual and self-instructional tutorial.

And remember — in today's interactive programming environment — your most important software tool is your text editor. ED-80 is already working in industry, government, universities, and in personal computing to significantly cut program development time and to reduce high labor costs. Why not let ED-80 begin solving your text editing problems today? ORDER NOW and we'll pay the postage!

Personal Computing Industry Report (PCIR)

PCIR is a monthly report on personal computing in business, professional, educational, hobby and home applications. The newsletter covers such topics as the market for board-level microcomputers including market shares and trends, reviews of popular microcomputer systems, the status of computer retail stores, and other items of general interest. PCIR is available from Vantage Research Inc, 2680 Bayshore Rd, Mountain View CA 94043, for \$195 for one year.

Appleseed Newsletter

Appleseed Newsletter, c/o The Computer Shop, 6812 San Pedro, San Antonio TX 78216, covers the current and future events of this Apple users group's meetings, which center around swapping programs, discussions and the use of new products.

Sorcerer User's Newsletter (SUN)

Sorcerer User's Newsletter is published monthly by Steven J Long, 792 Laurie Ave, Santa Clara CA 95050. Included are short programs sent by users, notes on problems or fixes, comments on accessories, and anything else which is of general interest to Sorcerer users. A program

library is available for use by subscribers. The subscription rate is \$10 per calendar year.

A New Apple Users Group

There is a new users group in New York City: The Big Apple User Group, 55 Water St, c/o Bruce Brewster, Drysdale Securities, New York NY 10004. For more information, contact Tony Cerreta, (914) 636-3417 or write to the above address. ■

BYTE's Bugs

Redundancy Rules These Pages...

Readers may have noted some redundancy in text on pages 8 and 10 of the November 1979 BYTE. As Murphy would have it, this was discovered in the final printed versions of BYTE, as opposed to the more typical discovery of such effects in the "blue line" proof copies we get of each issue. So, rest assured—if the paragraph beginning on page 10 looks familiar when you read it, it is indeed an inadvertent repeat of an incomplete paragraph at the bottom of page 8....CH

PRIORITY ONE ELECTRONICS

Don't miss our insert in the January 1980 issue of BYTE!

Put the BYTE on the IRS with Aardvark

In an era when computers are an integral part of business and entertainment, and computer software is more and more sophisticated, Aardvark is yet another breed in advanced computer software. Aardvark's Micro Tax series is a true user-oriented Federal Income Tax package. Specifically developed by qualified tax professionals for use on personal home computers, this low-cost, time-saving Aardvark Micro Tax package accurately and efficiently computes your federal income tax liability. Aardvark will display and fill in facsimile Form 1040 and related schedules and, if connected to a Centronics printer, will print out these facsimile forms auto-

matically. Each program is designed to use the appropriate tax table or rate schedule. The more advanced Micro Tax II and III also calculate Income Averaging, Maximum Tax on Earned Income, Minimum Tax and Alternative Minimum Tax. The Aardvark package is compatible with Apple II and TRS-80 users and includes an indexed instruction manual and input forms for easy input of tax data. To see how Aardvark can be tax-deductible, check the instructions in the binder of the manual. You can also use the binder to store pertinent 1979 tax records. Cure your headaches this tax season, order today...and put the BYTE on the IRS with Aardvark!

MICRO TAX I \$25

**North Star Horizon Timesharing
with
Hard Disk Interface**

In excess of 120 megabytes bulk storage capacity now possible. Several different hard disk units are available, interfaced to North Star DOS and BASIC.

Two to seven-user timesharing North Star Horizon integrated computer systems with: Dual density or quad capacity eight inch drives and/or hard disk units with your choice of a variety of printers.

A complete selection of innovative business application software is available for North Star* systems.

Foreign orders are our specialty. Dealerships are available. Call or write for descriptive literature, hard disk availability and/or dealer information package.

SUPER SOFTWARE!

MICROWARE 6800 SOFTWARE IS INNOVATION AND PERFORMANCE

LISP Interpreter

The programming language LISP offers exciting new possibilities for microcomputer applications. A highly interactive interpreter that uses list-type data structures which are simultaneously data and executable instructions. LISP features an unusual structured, recursive function-oriented syntax. Widely used for processing, artificial intelligence, education, simulation symbolic, and computer-aided design. 6800 LISP requires a minimum of 12K RAM.

Price \$75.00

A/BASIC Compiler

The ever-growing A/BASIC family is threatening old-fashioned assembly language programming in a big way. This BASIC compiler generates pure, fast, efficient 6800 machine language from easy to write BASIC source programs. Uses ultra-fast integer math, extended string functions, boolean operators and real-time operations. Output is ROMable and RUNS WITHOUT ANY RUN-TIME PACKAGE. Disk versions have disk I/O statements and require 12K memory and host DOS. Cassette version runs in 8K and requires RT/68 operating system.

Price: Disk Extended Version 2.1 \$150.00

Cassette Version 1.0 \$65.00

A/BASIC Source Generator

An "add-on" option for A/BASIC Compiler disk versions that adds an extra third pass which generates a full assembly-language output listing AND assembly language source file. Uses original BASIC names and inserts BASIC source lines as comments. SSB and SWTPC Miniflex version available.

Price: \$75.00

A/BASIC Interpreter

Here it is—a super-fast A/BASIC interpreter that is source-compatible with our A/BASIC compiler! Now you can interactively edit, execute and debug A/BASIC programs with the ease of an interpreter—then compile to super efficient machine language. Also a superb stand-alone applications and control-oriented interpreter. Requires 8K RAM. The cassette version is perfect for Motorola D2 Kits.

Price: \$75.00

RT/68 Real Time Operating System

MIKBUG—compatible ROM that combines an improved monitor/debugger with a powerful multitasking real-time operating system. Supports up to 16 concurrent tasks at 8 priority levels plus real time clock and interrupt control. Thousands in use since 1976 handling all types of applications. Available on 6830 (MIKBUG-type) or 2708 (EPROM-type) ROM. Manual is a classic on 6800 real-time applications and contains a full source program listing.

Price: RT68MX (6830) \$55.00

RT68MXP (2708) \$55.00

6800 CHESS

A challenging chess program for the 6800. Two selectable difficulty levels. Displays formatted chess board on standard terminals. Requires 8K memory. Machine language with A/BASIC source listing.

Price: \$50.00

Our software is available for most popular 6800 systems on cassette or diskette unless otherwise noted. Disk versions available on S.S.B., SWTPC, or Motorola MDOS. Please specify which you require. Phone orders are welcomed. We accept MASTERCHARGE and VISA. We try to ship orders within 24 hours of receipt. Please call or write if you require additional information or our free catalog. Microware software is available for OEM and custom applications.

Books from BITS inc PASCAL

MICROCOMPUTER PROBLEM SOLVING USING PASCAL
by Kenneth L. Bowles

This book is designed both for introductory courses in computer problem solving at the freshman and sophomore college level, and for individual self-study. Graphics is stressed in this version of the book. A complete single-user software system based on PASCAL has been developed at the University of California at San Diego, where the author is a professor in the Department of Applied Physics and Information Science. This system embodies extensions to the standard PASCAL which include the necessary functions and procedures for handling graphics and strings. 563pp.

#077 \$9.80

PASCAL USER MANUAL AND REPORT (Second Edition) by K. Jensen and N. Wirth

The manual is directed towards those who have some familiarity with computer programming and who wish to get acquainted with the PASCAL language. It is mainly tutorial and includes many helpful examples to demonstrate the various features of the language. The Report is a concise reference for both programmers and implementors. It defines Standard PASCAL, which constitutes a common base between various implementations of the language. 167pp.

#088 \$7.90

NEW A PRACTICAL INTRODUCTION TO PASCAL by I.R. Wilson and A.M. Addyman

PASCAL will soon supercede BASIC, and for good reason. It is a simple and efficient language, encouraging structured programming. Wilson and Addyman have written an introduction to PASCAL suitable for first time or experienced programmers. Describing PASCAL using syntax diagrams, the book encourages the step-wise refinement technique of structured programming. Over 60 programs are included as examples, and seven of its 14 chapters are devoted to data structures. 148pp.

#218 \$7.90

PROGRAMMING IN PASCAL by Peter Gorgono

This book is an excellent introduction to one of the fastest growing programming languages today. The text is arranged as a tutorial containing both examples and exercises to increase reader proficiency in PASCAL. Besides sections on procedures and files, there is a chapter on dynamic data structures such as trees and linked lists. These concepts are put to use in an example bus service simulation. 359pp.

#099 \$11.50

CONCURRENT PASCAL COMPILER by Alfred Hartman

This is a paper describing a seven-pass compiler for the Concurrent PASCAL programming language. It includes details about the pass structure, lexical analysis, syntax analysis, code assembly and implementation of the compiler. Concurrent PASCAL is an abstract programming language for computer operating systems. The language extends sequential PASCAL with the monitor concept for structured concurrent programming. Compilation of Concurrent PASCAL on a minicomputer is done by dividing the compiler into seven sequential passes. The passes, written in sequential PASCAL, generate virtual code that can be interpreted on any 16 bit computer. 119pp.

#137 \$8.40

AN INTRODUCTION TO PROGRAMMING AND PROBLEM SOLVING WITH PASCAL

by G. M. Schneider, S. Weingart and D. Perlman

This book introduces all aspects of the programming and problem solving process, including problem specification and organization, algorithms, coding, debugging, testing documentation and maintenance. Good programming style and how to produce a high quality finished product is brought out in numerous style examples throughout the text. PASCAL is used as a vehicle to teach various aspects of programming techniques. 359pp.

#070 \$14.95

∞ INFINITE BASIC ∞™

**RELOCATABLE MODULES FOR THE TRS LEVEL II AND DOS SYSTEMS
LOAD ANY OR ALL MODULES. FOR \$49.95 THE CORE PACKAGE INCLUDES:**

∞ MATRIX PACKAGE ∞

Over 30 BASIC commands including:

- ∞ Matrix Read, Inverse, Transpose, and Identity. Simultaneous Equations!!!
- ∞ Add, Subtract, or Multiply Scalars, Vectors, or Multi-dimension arrays!!!
- ∞ Dynamically Reshape, Expand, Delete Arrays, Change arrays in mid-program.
- ∞ Copy array elements, set arrays to scalar, zero arrays, move arrays.
- ∞ Tape array read and write including string arrays.

FOR \$29.95 more get the ∞ BUSINESS PACKAGE ∞

- ∞ Eliminate round-off error!! Multiple precision packed decimal arithmetic. 127-digit max. accuracy
- ∞ Binary search or sorted arrays. Insert new elements in sorted arrays!!!
- ∞ Automatic page headings, footings, and pagination. Includes forced end-of-page.
- ∞ Automatic hash for record retrieval!! And more for your professional packages.

∞ STRING PACKAGE ∞

Over 40 BASIC commands including:

- ∞ Left and right justify, truncate, rotate. Text justification. String centering.
- ∞ Delete or insert substring, Pack strings, Convert to upper or lower case.
- ∞ Translate characters, Reverse strings, Verify function, Number of occurrences.
- ∞ Masked string searches for simple or array variables. Encrypt or decrypt strings.
- ∞ Compress/uncompress character string arrays to 6 bits or less per character.
- ∞ AND the famous RACET machine language SORTS. Multi-key multivariable and string. Sort 1000 elements in 9 sec!!

FUTURE ∞ ADD-ON PACKAGES ∞ will include ∞ STATISTICS ∞ INPUT/OUTPUT ∞ GRAPHICS ∞

Attn: TRS Add-On OEM's: We can support your special hardware add-ons with direct BASIC commands. System Houses: We license System House usage of ∞ INFINITE BASIC ∞ modules.

COMMAND PROCESSOR 'COMPROC' for \$19.95 (DOS only)

Extend DOS-AUTO command to perform multiple steps either at power-up or as a user command. Execute a script consisting of a sequence of commands or data from a BASIC command file.

REMODEL + PROLOAD for \$34.95 (Specify 16, 32, or 48K version)

REnumber any section of a program, MOve program segments, DElete program lines. Combine programs with renumber and merge. Load or save any portion of program from tape.

DISK SORT PROGRAM 'DOSORT' for \$34.95 (Specify 32 or 48K, minimum 2 disk system)

SORT/MERGE multi-diskette sequential files. Multiple variables and keys. Includes machine language in-memory sorts, comparators and string handling.

COPY SYSTEM TAPES with 'COPYSYS' for \$14.95 (Non-DOS)

APL
APL
SOFTRONICS
μAPL for the 8080/8085/Z-80

©1979 Erik T. Mueller

APL is an interactive general-purpose programming language with powerful primitive functions. SOFTRONICS APL runs under the CP/M operating system. It is 'ready-to-go' in ASCII, using CP/M standard I/O. The interpreter runs in a variety of character set configurations. In addition to the standard ASCII mnemonic representations, it supports typewriter and bit-pairing ASCII-APL character sets. It can run with user-supplied I/O drivers.

FEATURES:

- Most of the functions and operators of full APL, including n-dimensional inner and outer product, reduction, compression, general transpose, reversal, take, drop. Execute and format.
- The interpreter resides in 30K bytes of memory, leaving remaining memory for the workspace and disk operating system.
- Shared-variable mechanism for CP/M disk input and output, system functions and variables, system commands.
- Abrams' descriptor calculus and shared data storage are the advanced optimization techniques employed by the interpreter. This saves memory space and execution time. Values are stored internally in a variety of formats for efficient memory utilization.
- Optional driver program for video display with programmable character generator.

ANOTHER FIRST FROM MOUNTAIN HARDWARE. SUPERTALKER.

GIVE VOICE TO YOUR APPLE.

SuperTalker allows you to add the dimension of human speech output in your computer programs. Add voice to games. Program verbal prompting for the operator of your business system. Use verbal warnings under program control as an enunciator in commercial security or control rooms. Create educational programs that verbally coach the student.

THE SUPERTALKER SYSTEM.

SuperTalker is a new Mountain Hardware peripheral system which allows the Apple II computer to output exceptionally high quality human speech through a loudspeaker under program control. Output may also be directed through any P.A. or stereo system. Initially, spoken words are digitized into RAM memory through the system microphone. Speech data in RAM may then be manipulated like any other stored data.

A COMPLETE PACKAGE.

The SuperTalker peripheral system consists of:
The SuperTalker peripheral card which plugs into

FOR YOUR APPLE II

a peripheral slot on the Apple II; a microphone; a loudspeaker; easy-to-use operating software and documentation; plus, two ready-to-run SuperTalker programs.

OPERATING SYSTEMS.

In order to achieve maximum utility using SuperTalker, the SuperTalker Disk Operating System permits output of human speech under program control with direct I/O routines.

It also provides a preparation program which permits the creation of voice files on diskette. BASIC program routines are provided

which require only one-line statements to output a word or phrase. Routines also support cassette storage.

TEACH YOUR COMPUTER TO TALK.

For \$279 assembled and tested, SuperTalker gives your Apple II a voice in the matter.

AVAILABLE NOW.

Mountain Hardware's SuperTalker, Apple Clock and 100,000 Day Clock™ (for S-100 bus computers) are available through computer dealers worldwide.

11 BASICs from BITS™

BASIC, From the Ground Up by David E. Simon.

This book is a good introduction to computing and the BASIC language for anyone, regardless of their background. David Simon assumes you have no previous programming experience and no familiarity with computing concepts. From the ground up, he builds on the fundamental concepts and teaches each part of the BASIC language in turn. Examples illuminate each step and six fully solved problems are included. This is the "beginner's book" in BASIC we at BITS have been looking for. 222 pages \$8.95.

NEW!

THE BASIC WORKBOOK — CREATIVE TECHNIQUES FOR BEGINNING PROGRAMMERS by Kenneth Schoman, Jr.

This book contains lecture notes, exercises and problems for people learning BASIC. In a hands-on workbook style, Kenneth Schoman covers statements, loops, functions, variables, input/output and strings. Simulation and plotting are introduced. The examples and problems are runnable in virtually any version of BASIC. If you're learning BASIC, complement your studies with this book! 117 pp. \$5.95

BASIC WITH STYLE: PROGRAMMING PROVERBS by Paul Nagin and Henry Ledgard.

"Programmers can and should write programs that work the first time." This statement may sound idealistic to those accustomed to long hours of debugging. Yet, it's the theme of this book — a unique collection of "proverbs" or rules and guidelines for writing more accurate error-free programs. Newly rewritten, this book now emphasizes structured programming and all examples are in BASIC. 134 pp. \$5.95

BASIC BASIC, 2nd EDITION by James S. Coan.

If you're not already familiar with BASIC, James Coan's **Basic BASIC** is one of the best ways to learn about this popular computer language. BASIC (which stands for Beginner's All-Purpose Symbolic Instruction Code) is easy to learn and easy to apply to many problems. **Basic BASIC** gives you step-by-step instructions for using a terminal, writing programs, using loops and lists, solving mathematical problems, understanding matrices and more. The book contains a wealth of illustrations and example programs, and is suitable for beginners on many different levels. It makes a fine reference for the experienced programmer, too. 256 pp. \$8.95.

ADVANCED BASIC by James S. Coan.

Advanced BASIC is the companion volume to James Coan's **Basic BASIC**. In this book you'll learn about some of the more advanced techniques for programming in BASIC, including string manipulation, the use of files, plotting on a terminal, simulation and games, advanced mathematical applications and more. Many useful algorithms are covered, including some clever sorting techniques designed to reduce program execution time. As with **Basic BASIC** there are many illustrative example programs included. BASIC doesn't have to be basic with **Advanced BASIC!** 184 pp. \$8.95

BASIC AND THE PERSONAL COMPUTER by Dwyer/Critchfield.

A fascinating book covering many areas of interest to the personal computer user. After giving an in-depth course in BASIC, which can be covered in 8 hours, the book discusses microcomputer hardware, graphics, word processing, sorting, simulation and data structures. This is an easy to read text that is useful for the beginner and informative for the advanced user. 438 pp \$12.95

THE LITTLE BOOK OF BASIC STYLE by John Nevison.

Structure, style, correctness, maintainability. Attributes of good programming are getting much attention, and well they should. When one considers what we invest in programs, their manageability and efficiency become very important. Here these concepts are explained, along with 19 rules and many examples in BASIC to help improve your programming style. 151 pp. \$5.95

SOME COMMON BASIC PROGRAMS by Lon Poole and Mary Borchers, published by Osborne and Associates.

At last, a single source for all those hard to find mathematics programs! **Some Common BASIC Programs** combines a diversity of practical algorithms in one book: matrix multiplication regression analysis, principal on a loan, integration by Simpson's rule, roots of equations, operations on two vectors, chi-square test, check writer, geometric mean and variation, coordinate conversion and a function plotting algorithm. These are just some of the many programs included. For only \$8.50 you can buy the kind of programs previously available only as part of software math package systems for large scale computers. All the programs are written in a restricted BASIC suitable for most microcomputer BASIC packages, and have been tested and debugged by the authors. 192 pp. \$9.50

BASIC WITH BUSINESS APPLICATIONS by Richard W. Lott.

This book focuses on the BASIC language and its application to specific business problems. The book is divided into two sections. Part one introduces the BASIC language and the concept of logical flowcharting. Part two presents problems and possible solutions. Topics include: interest rate calculation, break-even analysis, loan rates, and depreciation. Exercises at the end of each chapter give a greater understanding of BASIC by actual programming. This book is a great aid to the beginner wanting to learn BASIC without having a technical or scientific background. 284 pp. \$11.95

MORE BASIC COMPUTER GAMES edited by David H. Ahl.

Here are 84 new games from David Ahl and Creative Computing! Punch in Minotaur and battle with the beast; try Chuck-a-luck but bring your money; key in Eliza and unload your troubled mind to the doctor. They're all great fun. After all, what are computers for? 185 pp. \$7.50

GAME PLAYING WITH BASIC, by Donald D. Spencer.

You'll enjoy the challenge of competing with your own computer. Games described include: 3-D Tic Tac Toe, Nim, Roulette, Slot Machines, Magic Squares, Keno, Morra, Baccarat, Knight's Magic Tour, and many others. The style is non-technical, and each section gives complete rules for the game, how it works, illustrative flowcharts, and example outputs for each program. The last chapter contains 26 games for reader solution, including Hexapawn and Poker Dice. 166 pp. \$7.95.

PET Word Processor

8K
and
16/32K
PET
versions

This program permits composing and printing letters, flyers, advertisements, manuscripts, etc., using the COMMODORE PET and a printer.

Printing directives include line length, line spacing, left margin, centering and skip. Edit commands allow you to insert lines, delete lines, move lines and paragraphs, change strings, save files onto and load files from cassette (can be modified for disk), move up, move down, print and type.

Added features for the 16/32K version include string search for editing, keyboard entry during printing for letter salutations, justification, multiple printing and more.

A thirty page instruction manual is included.

The CmC Word Processor Program for the 8K PET is \$29.50. The 16/32K version is \$39.50.

Order direct or contact your local computer store.

Some Notes on Modular Assembly Programming

James Lewis
Micro Logic Corp
100 Second St #213
Hackensack NJ 07602

James Lewis is president of Micro Logic Corp, a microcomputer application firm involved in microprocessor applications ranging from LASER beam controllers to office systems.

Despite the dominance of BASIC over machine code (eg: assembly language) in the programming of personal microcomputers, a significant number of programs are written in machine code, and for many good reasons: machine programs usually run much faster than BASIC programs; machine coded programs do not require the overhead in memory space taken up by a BASIC interpreter; they often take less space than equivalent BASIC programs; and a BASIC interpreter may not be available on a given system.

The purpose here is not to further compare BASIC with machine code but rather

to discuss a good way to use machine code, given that it has been selected as the language of choice. The method to be described focuses on an important aspect of machine coding: the use of subroutines.

Example

The technique is best explained and illustrated with an example. Although 8080 code will be used (and regardless of whether or not the reader is familiar with 8080 machine code), the overall philosophy applies to other machines. The problem is to write a program that generates pseudorandom notes of music through a DAC (digital to analog converter). Incidentally, the example was implemented on a TRS-80 using a TRS-80-DAC board.

The Algorithm

The algorithm chosen to produce pseudorandom music is as follows:

1. Generate a pseudorandom number;
2. Initialize a cycle count to 32;
3. Initialize note value of 16 mV;
4. Count down from the pseudorandom number to 0 to produce a delay;
5. Output the voltage;
6. Multiply the voltage by -1 ;
7. Decrement the cycle count and go to 4 if not 0;
8. Return to the monitor if the shift key is down;
9. Otherwise go to 1.

This will produce random notes, each consisting of 32 square wave transitions and a voltage swing of +16 mV to -16 mV until the shift key is pressed to abort the program.

Listing 1: Nonmodular code for pseudorandom tone generator.

START	MVI	B,1	B = RUNNING RANDOM TOTAL
	MVI	C,16	C = DAC VOLTAGE
	MVI	D,32	D = CYCLE COUNT FOR A NOTE
LOOP1	MOV	A,B	A = LAST RANDOM NUMBER
	ADI	187	A = NEW RANDOM NUMBER
	MOV	B,A	B = NEW RANDOM NUMBER
	MOV	E,D	E = CYCLE COUNT FOR A NOTE
LOOP2	MOV	A,B	A = NEW RANDOM NUMBER
DLY	DCR	A	PRODUCE A DELAY BY COUNTING
	JNZ	DLY	DOWN FROM THE RANDOM NUMBER
	MOV	A,C	A = DAC VOLTAGE
	OUT	DPORT	SET DAC VOLTAGE
	CMA		MULTIPLY BY -1 BY TAKING
	INR	A	THE 2'S COMPLEMENT
	MOV	C,A	C = NEW DAC VOLTAGE
	DCR	E	DECREMENT CYCLE COUNT
	JNZ	LOOP2	LOOP IF NOT 0
	LDA	SHKEY	A = VALUE OF SHIFT KEY
	ORA	A	TEST A
	JZ	LOOP1	NEXT NOTE IF NOT PRESSED
	JMP	MONITOR	ELSE RETURN TO MONITOR

If you need to learn assembly language read what the critics say about this book

"This book is the best and most lucid introduction to Z80 programming that we have seen."

Digital Design

"Practical Microcomputer Programming is a very powerful series. It is well written and full of essential techniques for the assembly language programmer."

Byte

"This is an EXCELLENT book. . . This book is a must for all Z80 users. . . dirt cheap for such great software and documentation."

CACHE

In 18 chapters and 4 appendices **PRACTICAL MICROCOMPUTER PROGRAMMING: THE Z80** supplies EVERYTHING you need to learn to program the Z80 at assembly level. Essential assembly language techniques are explained in clear English and documented with more than 100 working example programs. The full SOURCE text of a conversational assembler and debugging monitor are given in appendices. This software will run on any Z80 based machine. Object code on either paper tape or TRS-80 Level II cassette is sent FREE when the coupon from the book is returned.

Don't pass up this unique opportunity to add this valuable programming skill to your repertoire.

6" x 9", 481 pages, hardcover, \$32.95

A powerful business language designed to run on Smoke Signal Broadcasting's 6800 based microcomputer line which offers the following capabilities:

- Handles all aspects of program development, from initial input of source programs, through compilation and testing, to the operation of a complete business system.
- Multi-user BOS (Business Operating System) allows for multiple users to interact with the computer at the same time.
- An interactive text editor, compiler, and linker and librarian.
- A wide range of application products including accounting systems, file management and report generating.

Smoke Signal Broadcasting's 'Chiefs' once again providing you with the high quality, reliable software for use on the increasingly popular Chieftain Series of 6800 based microcomputer.

Software licenses available to qualified dealers and software houses. Contact Jim Allday for further information.

We're the "CHIEF" in 6800 products software

Nonmodular Code

Listing 1 is the 8080 implementation of the above algorithm without using the modular machine code practice. For simplicity, the trivial algorithm of adding an arbitrary number like 187 to a running total is used to produce pseudorandom numbers.

The code first initializes some parameters. It then generates a simple pseudorandom number. After setting up a cycle count, it sets up a pseudorandom delay count and then executes the pseudorandom delay. It then outputs and inverts the note value, decrements the count, and loops if necessary. Next it checks for a user abort with the shift key and either loops or goes to the monitor.

This style of coding has many disadvantages over the modular style given in listing 2. It is relatively hard to follow, hard to explain, and hard to change. Compare it with the modular approach for yourself.

Listing 2: Modular code for pseudorandom tone generator. This form is better than the nonmodular form because each of the subroutines can be accessed separately and debugged more easily.

START	CALL	RANDOM	A = RANDOM NUMBER
	CALL	NOTE	GENERATE NOTE USING (A) AS FREQUENCY
	CALL	ABORT	ABORT TO MONITOR IF SHIFT KEY DOWN
	JMP	START	LOOP FOR NEXT NOTE
RANDOM	LDA	RANUM	A = OLD RANDOM NUMBER
	ADI	187	A = NEW RANDOM NUMBER
	STA	RANUM	SAVE NEW RANDOM NUMBER
	RET		RETURN TO CALLING PROGRAM
RANUM	DATA	1	INITIAL RANDOM NUMBER
NOTE	PUSH	B	SAVE B REGISTER VALUE
	MVI	B,32	B = 32 FOR CYCLE COUNT
LOOPN	CALL	DELAY	DELAY ACCORDING TO (A) REGISTER
	CALL	TOGGLE	FLIP DAC FOR SQUARE WAVE
	DCR	B	DECREMENT CYCLE COUNT
	JNZ	LOOPN	LOOP IF NOT 0
	POP	B	RESTORE B REGISTER VALUE
	RET		RETURN
DELAY	PUSH	PSW	SAVE THE (A) REGISTER
LOOPD	DCR	A	DECREMENT (A)
	JNZ	LOOPD	LOOP IF NOT 0
	POP	PSW	RESTORE THE (A) REGISTER
	RET		
TOGGLE	PUSH	PSW	SAVE THE (A) REGISTER
	LDA	VOLTAGE	A = CURRENT VOLTAGE
	CMA		MULTIPLY BY -1 BY TAKING
	INR	A	THE 2'S COMPLEMENT
	STA	VOLTAGE	SAVE NEW VOLTAGE
	OUT	DPORT	OUTPUT VOLTAGE TO DAC
	POP	PSW	RESTORE THE (A) REGISTER
	RET		GO BACK
VOLTAGE	DATA	16	INITIAL VOLTAGE VALUE
ABORT	LDA	SHKEY	A = VALUE OF SHIFT KEY
	ORA	A	TEST VALUE
	JNZ	MONITOR	GO TO MONITOR IF PRESSED
	RET		ELSE RETURN

The Modular Code

We now show a different approach to the coding of the same program. Even though the code that generates the pseudorandom number is only three lines, we will make a subroutine out of it called RANDOM. We will also transform the 2 line DLY loop into a subroutine called DELAY and create a subroutine called TOGGLE to invert the note value. A subroutine can also be set up to generate a note given a delay value called NOTE, which will call DELAY. Lastly we create a routine to check for a shift key abort called ABORT.

The result of modularizing the program in this way yields several advantages. Each of the subroutines is easily understood because of its simplicity, and will be useful, without changes, in more complex music synthesis programs and in unrelated programs. The code is easier to debug and modify. To be fair, it should be pointed out that the modular code in this case is longer and a bit slower. However these disadvantages are of little concern in this case; in fact, in more complex programs, the modular approach usually produces shorter code than the non-modular approach. Lastly, an important advantage of the modular style is a simplified main routine.

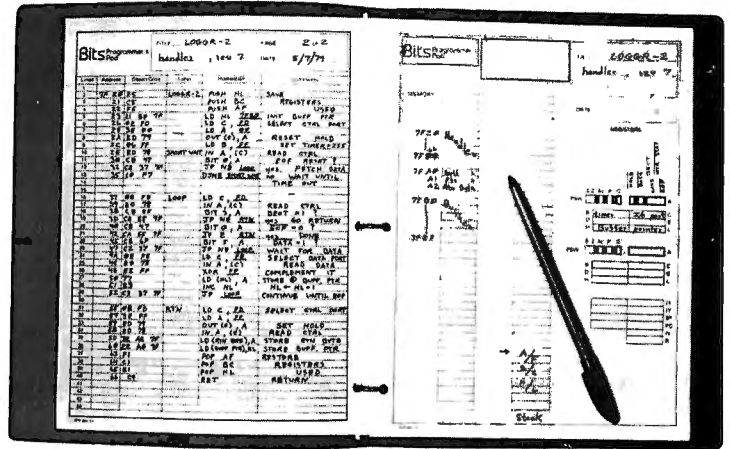

The main routine, START, is significantly easier to understand and modify than the original nonmodular version. Of course we still have to write the subroutines, but each one is so small that it will be simple to code.

The RANDOM routine is simple and, since it is in modular form rather than part of some nonmodular code, it can be used by other programs or extensions of the music program given here. (Actually it is a poor pseudorandom number generator, but the point of modularization still applies.)

The NOTE routine generates a note with frequency determined by the value of A. (Actually, A gives the period, but everything is random, anyway.) The NOTE routine uses both the TOGGLE and DELAY subroutines.

Although the NOTE routine is not completely general (eg: cycle count is fixed), it can be used in programs other than the random note generator. The DELAY routine which NOTE calls is also straightforward. It is applicable to numerous situations - wherever a short variable delay is needed. The next routine toggles the note value and outputs a voltage to produce the square wave. Lastly, ABORT finishes the program. This completes the modular implementation of the pseudorandom note generator program.

Smoke Signal Broadcasting announces...

AUTO CLERK

A file maintenance and report generation system designed to run on Smoke Signal Broadcasting's Chieftain Series of microcomputers with COBOL and BOS (Business Operating Systems).

- Requires no computer experience and no special training in order to automatically handle filing problems and reporting requirements.
- Requested information is displayed immediately, at computer speed, not filing cabinet speed.
- The user defines desired reports and the information they are to contain. Then the reports can be produced at any time.
- Stored information of general interest can be made readily accessible. Confidential information can be kept secret.
- All your information is in one place, the microcomputer. The small size means the system can reside at any convenient place in the office.

Let Smoke Signal Broadcasting, the 'experts', supply you with further information on AUTO CLERK, or COBOL, or BASIC, or FORTRAN.

Software licenses available to qualified dealers and software houses. Contact Jim Allday for further information.

Method Comparison

Note that the modular approach has generated several useful routines that can be used in either more complex music programs or even totally unrelated programs. This applies to every routine except the main routine, which is specific to the current application. Furthermore the main routine is easy to follow and hence modify. If one wanted to create, say, a melody generator, it would be a much easier task to do so with the subroutines than the nonmodular program. In some applications the increased size of the modular code would not be outweighed by the other advantages, but

in larger systems the modular approach usually generates less code. The modular version is also a little slower, but this is often of little concern.

Conclusion

The technique of breaking a machine language program down into very small logical subroutines yields numerous advantages and few disadvantages. It takes some practice to learn how to do this effectively and to see the benefits firsthand, but it is well worth the initial added effort.■

GIVE YOUR APPLE VISION FOR CHRISTMAS!

The DS-65 Digisector® opens up a whole new world for your Apple II. Your computer can now be a part of the action, taking pictures to amuse your friends, watching your house while you're away, taking computer portraits... the applications abound! The DS-65 is a random access video digitizer. It converts a TV camera's output into digital information that your computer can process. The DS-65 features:

- **High resolution:** 256 X 256 picture element scan
- **Precision:** 64 levels of grey scale
- **Versatility:** Accepts either interlaced (NTSC) or industrial video input
- **Economy:** A professional tool priced for the hobbyist

The DS-65 is an intelligent peripheral card with on-board software in 2708 EPROM. Check these software features:

- Full screen scans directly to Apple Hi-Res screen
- Easy random access digitizing by Basic programs
- Line-scan digitizing for reading charts or tracking objects
- Utility functions for clearing and copying the Hi-Res screen

Let your Apple see the world!

Smoke Signal Broadcasting announces... BUSINESS ACCOUNTS RECEIVABLE and INVOICE ENTRY SYSTEM

An on-line up-dating and reporting system which runs on Smoke Signal's Random DOS with 48K bytes and 500K bytes of disc storage which provide the following capabilities:

- Direct up-dating of account, invoice and payment information so that all changes are applied as entered.
- Audit records generated when account balance data is modified or an account is deleted.
- Invoice processing is used as the "front-end processor" for the accounts receivable system.
- Open invoices maintained in the system until payment is made.
- Billing information can either be printed or viewed on the CRT.
- Reports can be sorted by: account item number, account number, name, or zip code. Within each sequence, high and low ranges may be specified for each report.

Smoke Signal Broadcasting's Chieftain Series of 6800 based micro-computers has established a reputation of high quality, reliable equipment. This software package is designed to further enhance this reputation.

Software licenses available to qualified dealers and software houses. Contact Jim Allday for further information.

We're the "CHIEF" in 6800 products software

Event Queue

In order to gain optimum coverage of your organization's computer conferences, seminars, workshops, courses, etc, notice should reach our office at least three months in advance of the date of the event. Entries should be sent to: Event Queue, BYTE Publications, 70 Main St, Peterborough NH 03458. Each month we publish the current contents of the queue for the month of the cover date and the two following calendar months. Thus a given event may appear as many as three times in this section if it is sent to us far enough in advance.

DECEMBER 1979

December

WPI Programs, WPI is holding two-day courses in management skills for engineering and research and design supervisors; managing under pressure; energy conservation management; and management planning, scheduling and control.

For more information, contact Worcester Polytechnic Institute, Worcester MA 01609.

December

Computer Management in the 80s. Computer Power Management Corp, POB 1403, Rockville MD 20850, is giving one- and two-day seminars on computer management for executives. The courses cover data processing, word processing and printing, the role of data communications in data processing, and planning and supervising automated facilities and operations. The courses will be held in major cities in the US.

December

Yourdon Seminars. Yourdon Inc, 1133 Avenue of the Americas, New York NY 10036, is offering a series of seminars on software engineering, structure design and programming for microprocessors, data base modeling and design, programming in COBOL, and data base administration, throughout cities in the US during December.

December

Datapro Seminars, Datapro Research Corp, 1805 Underwood Blvd, Delran NJ 08075, is holding various seminars covering such topics as data communication, distributed systems, data processing, word processing, minicomputers and small business computers, and more. The seminars will be held in major cities around the US. They are two-day courses.

December 2-6

MUSE North American Annual Meeting, Bahia Mar Hotel and Yachting Center, Ft Lauderdale FL. This conference of Modcomp Users Exchange (MUSE) will feature technical sessions, workshops and user/manufacturer interface sessions on the use of Modcomp computers and their related software. Contact Kathy Black, MUSE, 4620 W Commercial Blvd, Suite 6C, Tamarac FL 33319.

December 3-5

Winter Simulation Conference, Holiday Inn, Em-

YOU THINK YOU'VE SEEN WORD PROCESSING SOFTWARE?

The **MAGIC WAND**TM Word Processing System offers you the best features of any system in the micro market

FEATURES INCLUDE:

- Full-screen text editor
 - Simple, control key operation
- Edit programs as well as text
 - Assemble, compile or run programs without modification
- Files larger than memory
 - Files up to 256K
- Library files
 - Merge part or all of one file with another
- Spool printing
 - Print a file while editing another
- Easy page formatting
 - Simple commands set margins, page length, etc.
- Override commands at run-time
 - Give any command from the keyboard as well as in file
- Variable pitch control
 - Change pitch in mid-line, even mid-word
- Up to 128 user-defined variables
 - String, numeric or dollar format
- Form letter generation from external data files
 - Compatible with both sequential and fixed-record files
- Conditional commands
 - Any command may be conditional
- Print to disk and/or printer
 - Save all or part of output on disk
- Switch from specialty printer to CP/M list device
 - Print the same file on either specialty or standard printer

EASE OF OPERATION

With all its power, the MAGIC WAND is remarkably easy to use. This is no accident. The command structure is designed to be flexible and logical so that you can perform basic functions with a minimum of commands.

We have included in the manual a step-by-step instructional program, for the person who has never used a word-processor before. The trainee uses sample files from the system disk and compares his work to simulated screens and printouts.

In addition to the lessons, the manual has a complete documentation of the command structure, special notes for programmers, an introduction to CP/M for non-programmers and a glossary. The manual is typeset, rather than typewritten, for greater legibility.

We have written the manual in non-technical English, because we want you to read it. We don't overload you with a bunch of jargon that could confuse even a PhD in Computer Sciences.

We send out newsletters so that users of the MAGIC WAND can learn special applications of the print commands. For example, we might show you how to create a mailing list or set up an index for a file.

In short, we've done everything we can to make things easy for you. Because the best software in the world is just a bunch of code if you can't use it.

64K RAM BOARD

The Z_S-SYSTEMS 64K RAM board is designed to operate in any Z80 based microcomputer having S-100 bus. It uses 16K dynamic RAM chips, & features:

- Board select
- Bank select
- Transparent on-board refresh
- 2 or 4MHz operation (w/ no wait state)
- Memory disable

FLOPPY DISK CONTROLLER

Handles with no modification up to:

- * 4 standard 8" drives (Shugart or compatible) or
 - * 3 minidrives 5"
- Run with 2 or 4 MHz CPU

Compatible with Cromemco and M/PM multiuser. Fully assembled, burned in, & tested. Available from stock to 60 days

As low as \$500.00 in quantities of 100

Price of one.....\$695.00

With 16K RAM.....\$359.00
Plus shipping charges

Smoke Signal Broadcasting announces...

BUSINESS INVENTORY CONTROL and ORDER ENTRY SYSTEM

An on-line inquiry system which runs on Smoke Signal's Random DOS with 48K bytes and 500K bytes of disk storage which provides the following capabilities:

- All reports can be sorted several different ways. High and low ranges may be selected for each report.
- On line capability means any report can be requested at any time and will always show current status.
- Recording of sales automatically reduces inventory. Back orders are automatically generated.
- Bill of Materials function allows for automatic component updating when items are sold.
- Component list can include "comment" lines for inclusion of overhead, labor, etc.
- Projected Parts Report allows for forecasting results of producing a specific product mix.
- Where-Used Report lists every occurrence of a component and the quantities in each major item.

This business package enhances the reputation for quality and reliability established by Smoke Signal Broadcasting's Chieftain family of 6800 based microcomputers.

Software licenses available to qualified dealers and software houses. Contact Jim Allday for further information.

We're the "CHIEF" in 6800 products software

SMOKE SIGNAL BROADCASTING®

31336 Via Colinas, Westlake Village, CA 91361, (213) 889-9340

barcadero, San Diego CA. This conference will feature papers and panel discussions on discrete and combined (discrete and continuous) simulations. Contact Professor Robert E Shannon, University of Alabama in Huntsville, School of Science and Engineering, POB 1247, Huntsville AL 35807.

December 3-5

Crime by Computer, San Francisco CA. The seminar will address the following topics of what is becoming a leading crime category: computer crime methods, changing nature of business crime, the computer criminal, vulnerability, security techniques, principles of safeguard, and the auditor's role and tools.

For more information, contact Infotech International Inc, 234 E Colorado Blvd, Pasadena CA 91101.

December 3-5

The Application of Computer Technology to Accounting Systems, Washington DC. The theme of the conference is "Information Systems as a Management Tool for the Financial Executive." The conference is sponsored by the Association of Government Accountants (AGA). Contact Ken Burroughs, DBD Systems Inc, 1500 N Beauregard St, Alexandria VA 22311.

December 3-5

Implementing Cryptography in Data Processing and Communications Systems, New York NY. Going beyond an introduction to cryptographic systems, the seminar will stress implementation of the DES and address public key implementation considerations. Contact Ms Jansen, Cryptotech, 12 Station Rd,

Bellport NY 11713, (516) 286-2626.

December 3-5

COMDEX '79, MGM Grand Hotel, Las Vegas NV. This conference and exposition for third-party sellers of computer systems, word processing systems, peripherals, software packages, and media will focus on solutions to business problems normally encountered in structuring a successful dealership and the operational aspects of the dealership from both the supplier and customer's side. Contact The Interface Group, 160 Speen St, Framingham MA 01701.

December 3-7

Pascal Programming for Mini and Microcomputers, Holiday Inn, Palo Alto CA. This course covers a general approach to the use of high-

level languages in small computers, including an intensive course in Pascal programming, a preview of ADA (the evolving Department of Defense standard real-time language), and an introduction to structured programming techniques.

For additional information, contact the Institute for Advanced Professional Studies, 1 Gateway Ctr, Newton MA 02158.

December 4-6

Understanding and Using Computer Graphics, New York NY. Computer users in business or engineering firms are invited to this conference covering computer graphics, data processing, systems analysis and design, financial management and analysis, and more. Contact Frost and Sullivan, Dept C-2 106 Fulton St, New York NY 10038.

BUSINESS APPLICATIONS

FROM THE ORIGINATOR OF THE TRS-80 PROJECT

ACCOUNTS RECEIVABLE

Accounts receivable is a low volume invoice system. An entry may be invoiced at any time — before ready for billing, when ready, after billed, even after paid. It even has progress billing which keeps track of milestone payments made at intervals. The program allows automatic posting to the General Ledger and will interface with a future mailing list program for making bulk mailings to customers. Accounts Receivable does not print invoices. Reports:

- Not billed
- Open and Closed Invoices
- Aging Analysis
- Customer Statements
- Customer Activity List

6800 SYSTEM SOFTWARE

Unmatched • Field Proven • Documented • Industry Wide

SDOS™

A totally interrupt-driven (both disk and other peripherals) disk operating system, including type-ahead. Provides device independent, byte addressable random files. Supports any mixture of disk drives up to 2.5 BILLION bytes per drive. Disk files can grow dynamically to match application needs. Automatic, overlapped read-ahead on sequential files and LRU sector buffer pooling on random-access files optimize disk I/O. System utilities allow operator file manipulation, disk initialization, backup with wildcard file selection, and disk structure repair facilities to handle the infrequent but unavoidable disasters that occur in the real world. Turn-key application systems can be easily built, coupled with SD Business Basic. 242 pages of documentation.

IDB

A RAM or EPROM-based assembly language debugger. Provides single-step with register display, multiple real-time conditional breakpoints, memory dump, multiple data display and entry modes. Can be used to debug interrupt-driven code. 39 pages of documentation.

6800 Hardware supported:

Conrac Model 480 (AMI MDC) + ICOM floppy
WaveMate + Perci floppy (1771 + DMA)
Electronics Product Associates + ICOM floppy
Motorola EXORcisor + EXORDisk I or II
SWTP + mini or DMAF floppy (FLEX)
CMI 6800 + Winchester (16M) + Calcomp floppy (1771 + DMA)
MSI 6800 + FD-8 mini-floppy or 10M cartridge disk
Mizar Labs + double density Micropolis drives (1791 + DMA)
SSB Chieftain—mini or 8-inch floppy
Computer and Data Machines (England)

BUSINESS BASIC COMPILER

A super fast application oriented BASIC. 10 digit BCD for values to 100 million dollars with pennies. Random access to variable size, variable content records. Long, meaningful variable names, formatted output, IF-THEN-ELSE with multiple statements per line, and error-trapping make this BASIC extremely powerful. Compiled code, automatic integer optimization, and fast floating point make applications written in SD Basic run faster than on virtually any other microcomputer, and protect the source code of the application. 104 pages of documentation.

EDIT

A powerful and easy to use text editor with change, delete, insert, and remove commands. Automatic display of text or context changes, macro facilities for complex or repetitive editing. 44 pages of documentation.

ASM

A lovely 2 pass assembler with conditional assembly, long labels, symbol table dump and cross-reference, error cross-reference, extensive arithmetic and listing control. 103 pages of documentation.

Write for a free catalogue or contact the hardware manufacturer.

All SD software comes with a 1 year warranty.

Smoke Signal Broadcasting announces...

AUTO INDEX

A computerized automatic data storage and retrieval system designed to run on Smoke Signal Broadcasting's Chieftain Series of microcomputers with the COBOL and BOS (Business Operating System).

- Performs the same function as manual card index and file systems.
- Allows the non-computer specialist to input and edit text records with a minimum of training.
- All records in storage can be searched for particular user defined characteristics, i.e., college graduates, EE degrees, specialist in computers living in Southern California, stock records, customer names, prospect lists, membership lists, etc.
- Instant, automatic access to file information.
- Increases office efficiency.
- Assures security of confidential information.

Another example of Smoke Signal Broadcasting's popular line of high quality business software.

Software licenses available to qualified dealers and software houses. Contact Jim Allday for further information.

December 8-9

Data Processing for Business People, Cherry Hill Inn, Cherry Hill NJ. Management Information Corp presents this seminar to meet the needs of company management in understanding computers. The seminar includes basic concepts of data processing, alternatives (service bureaus, time-sharing), small business computer systems, program packages availability and selection, managing the computer system, and the future of data processing. Contact Management Information Corp, 140 Barclay Ctr, Cherry Hill NJ 08034.

December 10-11 and December 13-14 New York NY and Washington DC, respectively, **New User Documentation Workshops**. These two-day workshops will focus on how to write good data processing user-manuals with emphasis on analysis of specific user needs, planning

and outlining, effective writing, illustration and packaging of documentation. The program includes lectures on basic concepts followed by small group discussions.

Contact Progressive Communications Inc, The Alamo 310, 128 S Tejon St, Colorado Springs CO 80903.

December 10-11

Mini and Microcomputers in Control, Galt Ocean Mile Hotel, Ft Lauderdale FL. This symposium will cover computer architecture and hardware for control, languages for control, algorithms for control, hierarchical control, methodology, and other topics. Contact The Secretary, Computers in Control Symposium, POB 2481, Anaheim CA 92804.

December 10-12

Project Management for Computer Systems, Chicago IL. This seminar will illustrate techniques for

planning, implementing, installing, and controlling projects. Contact The University of Chicago, 1307 E 60th St, Chicago IL 60637.

December 10-13

1979 Fall DECUS US Mini/Midi Symposium, San Diego CA. This symposium is an opportunity for Digital Equipment computer users to participate in a technical exchange. Contact DECUS, One Iron Way, MR2-3, Marlboro MA 01752.

December 10-14

IEEE Computer Society's Tutorial Week 79, Hotel Del Coronado, San Diego CA. Fifteen different one-day seminars will be offered throughout the week. Contact IEEE Computer Society, POB 639, Silver Spring MD 20901.

December 10-14

Advanced Programming Workshop, Lafayette IN. Course objectives include

developing skills required to plan, prepare, test, and document software. Projects will include using assemblers and high-level language compilers and interpreters. Contact Wintek Corp, 902 N 9th St, Lafayette IN 47904.

JANUARY 1980

January 3-4

Hawaii International Conference on System Sciences, Honolulu HI. The conference will cover developments in theory or practice in software and hardware, and advanced computer systems applications in selected areas with emphasis on medical information processing and computer-based decision support systems for upper level managers in organizations. For more information, contact Perry G Patteson, Office of Management Programs, University of Hawaii, 2404 Maile Way, Honolulu HI 96822.

January 5-8

International Winter Consumer Electronics Show, Las Vegas Convention Center, Grand Ballroom of the Las Vegas Hilton and the Jockey Club Hotel, Las Vegas NV. The show will have over 850 exhibitors covering markets including audio systems, software, television and video tape and disk systems, home computers, calculators, and many more. Contact Consumer Electronics Shows, 2 Illinois Ctr, Suite 1607, 233 N Michigan, Chicago IL 60601.

January 15

Invitational Computer Conference, Orange County CA. New developments in computer and peripheral technology such as Pascal systems, 2-page printers, and streaming tape drives, will be featured in this conference directed to the quantity buyer. For more information, contact B J Johnson and Associates, 2503 Eastbluff Dr, Suite 203, Newport Beach CA 92660.

SUPERPASCAL

**5-10 times faster...
and more!**

Meet Pascal/Z™, the fast, flexible compiler with higher speed, greater efficiency and improved debugging:

- **True Z-80 native code Pascal compiler**—5-10X faster than competing P-code implementations—*no interpreter required.*
- **The only multi-tasking Pascal**—produces ROMable re-entrant code.
- **Optimized for fastest execution**—recognizes and exploits special cases.
- **Easily transportable**—all hooks to your system made through support library.
- **Includes IEEE standard floating point package.**

Single copy on CP/M-compatible disk includes compiler, companion macro-assembler & source of the library, \$275. OEM licenses available. Write or call for more information.

Smoke Signal Broadcasting announces... 6809 DISC OPERATING SYSTEM

DOS 69 is Smoke Signal Broadcasting's new 6809 Disc Operating System that contains all the features of DOS 68 version 5.

- Compatible with text files created under DOS 68.
- Includes improved 6809 SMARTBUG ROM monitor on 2716.
- Includes a 6809 BASIC that is completely compatible with Smoke Signal Broadcasting's 6800 BASIC.
- 6809 Text Editor included.
- 6809 Assembler at no extra cost. This assembler will operate under either DOS 68 or DOS 69 and will both assemble new 6809 source code and translate 6800 source code to 6809 object code. (This is not the same as Smoke Signal Broadcasting's MACRO 69 Macro Assembler).

NOTE: DOS 69 is supported on Smoke Signal Broadcasting's Chieftain systems with Smoke Signal Broadcasting's 6809 CPU board; and on SWTPC systems with Smoke Signal's BFD or LFD disc system and SWTPC 6809 CPU board (I/O moved to \$E000 in accordance with SWTPC instructions). Support for other hardware configurations including consultation on operation with other CPU boards cannot be provided.

Price \$100.00 including ROM monitor. Specify 5" or 8" disc and Chieftain or SWTPC System.

SMOKE SIGNAL BROADCASTING®

31336 Via Cotinas, Westlake Villiag, CA 91361, (213) 889-9340

January 15-18

TV-Microelectronics and Microprocessing Exhibition, National Exhibition Centre, Birmingham, England. Manufacturers and suppliers of microprocessors, electronic and microcomputer games, video display units, video cameras and projection systems, and digital consumer electronics are invited to participate. Over 9000 retailers, wholesalers, distributors and government buying authorities are expected to attend this show. For more information, contact TMAC, 680 Beach, Suite 428, San Francisco CA 94109.

January 23-26

International Microcomputers Minicomputers Microprocessors (IMMM), Harumi Exhibition Centre, Tokyo Japan. This is a show for manufacturers, commercial and financial establishments, service industries and institutions, and

design engineers interested in buying computer systems, components and services. For more information, contact Industrial and Scientific Conference Management Inc, 222 W Adams St, Chicago IL 60606.

January 28-30

Communication Networks '80, Sheraton Washington Hotel, Washington DC. The program will offer 50 conference sessions in areas such as fiber optics, satellite communications, systems networks, and innovations in electronic mail and office administrative networks.

For further information on registration, speaking opportunities or exhibit space, contact William Leitch, The Conference Co, 60 Austin St, Newton MA 02160.

January 28-30

Principles of Programming Languages, Las Vegas NV. This symposium concerns practical and theoretical

aspects of principles and innovations in the design, definition, and implementation of programming languages. Some topics are algorithms and complexity bounds for language processing tasks, specification languages, error detection and recovery, and unusual or special-purpose languages that raise issues of principle. Contact Professor John Werth, Department of Mathematical Sciences, University of Nevada, Las Vegas NV 89154.

January 30-February 1

MIMI '80 Asilomar, Asilomar Conference Grounds, Pacific Grove CA. This symposium covers all aspects of mini and microcomputers including technology, hardware, software engineering, languages, education and more. Contact The Secretary, MIMI '80 Asilomar, POB 2481, Anaheim CA 92804.

FEBRUARY 1980

February 6

Invitational Computer Conference, Ft Lauderdale FL. This conference is directed to the quantity buyer and will feature the newest developments in computer and peripheral technology. Contact B J Johnson and Associates, 2503 Eastbluff Dr, Suite 203, Newport Beach CA 92660.

February 13-15

The IEEE International Solid State Circuits Conference, San Francisco CA. This conference is a forum for the presentation of advancements in all aspects of solid state circuits. It will cover design, performance, fabrication, testing, and applications in digital, analog, microwave, and other areas of new solid state circuits, device structures, phenomena and systems. For more information, contact Lewis Winner, 301 Almeria Ave, POB 343788, Coral Gables FL 33134.

February 18-21

European Information Management Exhibition and Conference, Wembley Conference Centre, London, England. This show will exhibit microcomputer systems and peripheral items with demonstrations and applications focused on problem solving for the management executive. Contact, Ex-poconsul, 420 Lexington Ave, New York NY 10017.

February 25-27

Communication Networks '80, Shoreham Americana Hotel, Washington DC. This conference and exposition will cover business communications. For program information, contact the Director of Program Development, The Conference Co, 60 Austin St, Newton MA 02160. For exhibit information, contact the national sales manager, Communications Networks '80, POB 96, Haddon Heights NJ 08035.

TRS-80® BUSINESS SOFTWARE

Why not buy THE GENUINE ARTICLE???

The Osborne & Associates applications (Payroll with Cost Accounting, Accounts Payable & Accounts Receivable, and General Ledger) are on their way to becoming the standard applications software in the microcomputer field.

The genuine O&A software is written in CBASIC® for the CP/M® Operating System. Any other combination of language and operating system represents a reprogramming effort... for the TRS-80, Model I, several organizations have done such a reprogramming in Disk BASIC under TRSDOS. These packages have certain drawbacks such as having some features of the application removed. In addition, the fact that they are written in a source interpreter BASIC causes the comments in the source programs (if these are distributed at all) to be removed in the interest of saving space and execution time. Since CBASIC is a compiled language, comments cost nothing (in either space or execution time) in the executable version of the file—but such comments are invaluable in the later program maintenance and modification that is always required on applications software. Without having such comments, it is easy to spend many times the cost of the software on just one modification/maintenance effort. A buyer should take this into consideration when looking at the apparent cost of the package. The CBASIC source programs we sell are heavily commented to aid the programmer.

Our programs are **THE GENUINE ARTICLE**... the CBASIC source code as developed by Osborne & Associates. We furnish the buyer BOTH the TRS-80, Model I version (requires a 48K Model I with two or more disks) AND the unmodified 8" version (for later use on the TRS-80, Model II or other 8" CP/M system)... at no extra charge. By using our DOWNLOAD program, it is possible to start using the applications on the Model I, and then when the Model II is up and running at a later date, download the data files from the Model I to the Model II and keep running the same applications without disrupting your operation.

The Osborne & Associates books have been rewritten to reflect the CP/M, CBASIC versions of the applications. These books can be purchased either from your local computer store or from us directly. We can see no percentage in your buying other than **THE GENUINE ARTICLE**... which is what we sell... the Osborne & Associates source programs in CP/M and CBASIC.

Smoke Signal Broadcasting announces...

COMMERCIAL PAYROLL SYSTEM

A payroll system which runs on Smoke Signal Broadcasting's Random DOS with 48K bytes and a 500K byte disk which offer the following capabilities:

- Direct updating of employee information, hours worked, wages, deduction, etc., means that any inquiry for a selected employee will provide up to the minute status on that employee.
- Simultaneously handles hourly, salary and commissioned employees; weekly, bi-weekly, semi-monthly and monthly pay periods.
- Allows for payment against a cash advance.
- Vacation and sick hours accrue either as a rate per hour worked, or on anniversary dates. Time charged automatically reduces the amount available.
- Password protection maintains confidentiality of data.
- Generates ten reports including employee status, activity reports and audit report.
- All reports can be sorted several different ways. Reports can be generated for specific categories and can even be limited to ranges within the categories.
- Tax tables are easily modified with built-in routines. The system also handles state and local taxes.

Look to Smoke Signal Broadcasting to provide the high quality business software to run on the popular Chieftain Series of 6800 based microcomputers.

Software licenses available to qualified dealers and software houses. Contact Jim Allday for further information.

VULCAN = DBMS

THE PROFESSIONAL DATABASE MANAGEMENT SYSTEM

For 8080/Z80 systems under CP/M or PTDOS

- * **VULCAN** is a complete database management system that has 38 powerful, easy to learn, English-like commands to manipulate files, records, fields, and scratch-pad variables.
- * **VULCAN** has a command repertoire which includes such commands as: SORT, REPORT, APPEND, INSERT, EDIT, COPY, REPLACE, LOCATE, DISPLAY, DO, LIST, and LOOP.
- * **VULCAN** structured data records can be selectively chosen for processing using complex Boolean, string, or mathematical expressions.
- * **VULCAN** can be used in interactive or program mode. The program mode uses modern structured command programs to combine powerful DBMS operations.
- * **VULCAN** is written in assembly language for efficient information processing and requires 36K bytes CP/M system and one or more disk drives.
- * **VULCAN** can accept or store data in standard ASCII files to be compatible with BASIC, FORTRAN, etc.

*VULCAN (CP/M or PTDOS)	\$490

Smoke Signal Broadcasting announces...

FORTRAN

A powerful scientific programming language complete with sub routine capability designed to run on 6800 based microcomputers.

- Complete FORTRAN Compiler for the 6800.
- Produces Relocatable Object Code.

Included with the compiler is the Smoke Signal Linking Loader which loads the object code produced by the compiler into any portion of memory specified by the programmer. FORTRAN is completely integrated to operate with DOS 68, Smoke Signal's Disc Operating System and is ideal for scientific applications, number crunching and three dimensional array processing.

New updated FORTRAN includes large sub-routine library of mathematical functions.

\$149.00 on 5" disc.
(Add \$1.00 for 8" disc).

Learn to program your microcomputer using Assembly Language

Assembly Language Programming primers for these five microprocessors, by Lance Leventhal.

Each book explains assembly language programming, describes the functions of assemblers and assembly instructions, and discusses basic software development concepts. A special section on structured programming complements the many practical programming examples, which range from simple memory load loops to complete rudimentary design projects.

JUST ARRIVED

6502

and COMING SOON

6809

In each book you'll find:

- Over 80 programming examples tailored to your microcomputer, with source program, object code, flowcharts, and explanatory text.
- Each instruction fully explained
- Assembler conventions
- I/O devices and interfacing methods
- How to program the interrupt system
- **Table of Contents:** Introduction to Assembly Language Programming; Assemblers; The Assembly Language Instruction Set; Simple Programs; Simple Program Loops; Character Coded Data; Code Conversion; Arithmetic Problems; Tables and Lists; Subroutines; Input/Output; Interrupts; Problem Definition and Program Design; Debugging and Testing; Documentation and Redesign; Sample Projects.

Smoke Signal Broadcasting announces...

6809 MACRO ASSEMBLER

Macro 69 is an advanced assembler designed to let the professional programmer take full advantage of the capabilities of the world's most powerful 8 bit microprocessor.

- Supports conditional assembly.
- Produces relocatable object code.
- Includes linking loader.
- Operates under DOS 68 or DOS 69.
- Assembles 6809 code and translates 6800 source code to 6809 object code.
- Cross-referenced symbol table provided.
- Very powerful macro instruction capability.

Smoke Signal Broadcasting, your number one source for high quality, reliable products.

Price — \$199.00 for 5" disc
 (add \$1.00 for 8" disc.)

We're the "CHIEF" in 6800 products software

SMOKE SIGNAL BROADCASTING®

31336 Via Colinas, Westlake Village, CA 91361, (213) 889-9340

IMMEDIATE DELIVERY

Domestic & Export

DEC LSI-11 COMPONENTS

A full and complete line with software support available.

Mini Computer Suppliers, Inc.

25 CHATHAM ROAD
SUMMIT, NEW JERSEY 07901
SINCE 1973

(201) 277-6150 Telex 13-6476

SOFTWARE TOOLS

- C compilers and cross-compilers for PDP-11's, LSI-11's, 8080's and Z/80's, with complete runtime library. **The full language is supported with efficient code generation.**
- Interface libraries giving access to all system directives for UNIX,* RT-11, RSX-11M, RSTS/E, IAS, CP/M, CDOS and ISIS-II.
- A-Natural narrative assembler for 8080's and Z/80's with librarian and linking loader.
- Over 75 installations in less than six months.

*UNIX is a trademark of Bell Laboratories.

Continuing maintenance and training available. An affordable alternative to Assembler, Fortran or Pascal, for as little as \$500 per compiler binary license. Catalogue and references available upon request.

TRS-80 disk software

DATA BASE MANAGER IOM-III 32K \$49
You can use it to maintain a data base & produce reports without any programming. Define file parameters & report formats on-line. Features key random access, multi-keys, sort, field arith, audit log. Enhanced version \$69.

ACCCOUNT manage client accounts & accounts receivable. Order entry. Print invoices, statements & reports. 32K \$69.

WORD PROCESSOR 16K \$39
Our Word-III is the first word processor specifically designed for the TRS-80 that uses disk storage for text. Written in BASIC. No special hardware and text limit. Use for letters, manuals & reports. 32K version features upper/lower case without hardware change. \$49.

MAILING LIST 16K \$35
Lets you maintain data base and produce reports & labels sorted in any field. Random access. 2-digit selection code used. 32K version fast SHELL sort \$49. Advanced version with report writer \$59.

INVENTORY 16K \$39
While others use inefficient sequential file, we use 9-digit alphanumeric key for fast on-line random access. Reports give order info, performance summary, etc. Enhanced 32K version \$49.

KEY RANDOM-ACCESS UTIL 16K \$19
Lets you access a record by specifying a key. Features hashing, blocking, buffering technique.

Send \$5 for each manual.

MOO-II, superior, integrated software available.

MICRO ARCHITECT

96 Dothan St., Arlington, MA 02174

DUNJONQUEST™ Presents

- Take your favorite character—or let the computer create one for you!
- Let the Book of Lore guide you through a DUNJONQUEST™ within the Temple.
- Decide to fight the monsters or grab the treasure and run—but don't think too long—they'll come after you!

The Temple of Apshai—for the TRS-80 (Level II, 16K) and PET (32K) microcomputers.

Ask your local dealer or send a check for \$24.95 to:

VISIT THE VAULT OF THE DEAD!
The Vault of the Dead is but one of the many dark and fearsome mysteries within the ruined Temple of Apshai. The Temple of Apshai is your first adventure in the DUNJONQUEST™ series of fantasy role playing games. DUNJONQUEST™ is a complete game system and The Temple of Apshai is a complete fantasy adventure game for you and your microcomputer.

**OVER 200 ROOMS!
OVER 30 MONSTERS!
OVER 70 TREASURES!**

Twenty-four Ways to Write a Loop

Dr Maurer Takes You Through a Loop

W D Maurer
Professor Dept of Electrical
Engineering and Computer Science
George Washington University
Washington DC 20052

To start with, let us look at table 1. There are several things about this table that should be surprising.

All we are trying to do is move some quantities from one place to another. There are N of them, and they are called $P(1)$ thru $P(N)$. We are trying to move them to $Q(1)$ thru $Q(N)$, which we could do, of course, using a FOR statement in BASIC, as follows:

```
10 FOR J=1 TO N
20 Q(J)=P(J)
30 NEXT J
```

which should make sense even if you don't know BASIC. But we are trying to do this without a FOR statement, in order to learn how loops function; and immediately we are confronted with a wide variety of choices. Table 1 shows the first twenty-four of these. They are all different; they are all short; and they all do exactly the same thing. (Well, not quite exactly. At the end of some of them, J is equal to $N+1$; at the ends of others, J may be equal to N , or to 1, or to 0. But since we are presumably not going to use J after we finish the loop, this should make no difference.)

Why are there so many ways to write a loop? There are certain things

.....
Actually, 124 ways (or more) illustrate the endless variety of looping - that simplest of programming techniques
.....

we can do in either of two (or more) ways.

We can start with $Q(1)$ and go up to $Q(N)$ (first and second columns in table 1), or we can start with $Q(N)$ and go down to $Q(1)$ (third and fourth columns).

We have three things to do in the loop: setting $Q(J)$ equal to $P(J)$; increasing (or decreasing) J by one; and making a test. These three things may be arranged in any of six ways; denoting them by U , V , and W , we may arrange them as UVW , UWV , VUW , VWU , WUV , or WVU . Each of these six arrangements corresponds to one of the six rows of table 1.

What may be further surprising about table 1 are the subtle ways in which not everything is quite symmetrical. For example, in the last column, the variable J is sometimes initialized to N , and sometimes to $N+1$. The latter takes a bit more time (unless N is really a constant, such as 10). In the first column, J is

sometimes set to 1 and sometimes to 0, which on many computers takes a bit less time than setting it to 1.

It does not take much ingenuity, however, to see that in enumerating twenty-four ways to write a loop, we have really only scratched the surface. What are some of the other things we could have done?

Looking at the top of the second column, we see that we are testing whether J is less than or equal to N . We could just as easily have tested whether J is less than $N+1$. The same sort of change could have been made throughout the second and fourth columns, giving us a total of thirty-six ways to write a loop.

Most of the changes of this kind would rather obviously have been changes for the worse. It clearly takes more time testing against $N+1$ than it does testing against N , even if we set some new variable like $N1$ to $N+1$ before the loop and then test against $N1$ inside the loop. A possible exception to this is the one at the top of the last column, where we could have tested for J greater than 0. In assembly language on a 6800-based system using 8-bit signed integer data, you can do this with a branch-if-greater-than-zero (BGT) instruction directly after the decrementing.

10 J = 1 20 Q(J) = P(J) 30 J = J + 1 40 IF J < > N + 1 GOTO 20	10 J = 1 20 Q(J) = P(J) 30 J = J + 1 40 IF J < = N GOTO 20	10 J = N 20 Q(J) = P(J) 30 J = J - 1 40 IF J < > 0 GOTO 20	10 J = N 20 Q(J) = P(J) 30 J = J - 1 40 IF J > = 1 GOTO 20
10 J = 1 20 Q(J) = P(J) 30 IF J = N GOTO 60 40 J = J + 1 50 GOTO 20	10 J = 1 20 Q(J) = P(J) 30 IF J > = N GOTO 60 40 J = J + 1 50 GOTO 20	10 J = N 20 Q(J) = P(J) 30 IF J = 1 GOTO 60 40 J = J - 1 50 GOTO 20	10 J = N 20 Q(J) = P(J) 30 IF J < = 1 GOTO 60 40 J = J - 1 50 GOTO 20
10 J = 0 20 J = J + 1 30 Q(J) = P(J) 40 IF J < > N GOTO 20	10 J = 0 20 J = J + 1 30 Q(J) = P(J) 40 IF J < N GOTO 20	10 J = N + 1 20 J = J - 1 30 Q(J) = P(J) 40 IF J < > 1 GOTO 20	10 J = N + 1 20 J = J - 1 30 Q(J) = P(J) 40 IF J > 1 GOTO 20
10 J = 0 20 J = J + 1 30 IF J = N + 1 GOTO 60 40 Q(J) = P(J) 50 GOTO 20	10 J = 0 20 J = J + 1 30 IF J > N GOTO 60 40 Q(J) = P(J) 50 GOTO 20	10 J = N + 1 20 J = J - 1 30 IF J = 0 GOTO 60 40 Q(J) = P(J) 50 GOTO 20	10 J = N + 1 20 J = J - 1 30 IF J < = 0 GOTO 60 40 Q(J) = P(J) 50 GOTO 20
10 J = 1 20 IF J = N + 1 GOTO 60 30 Q(J) = P(J) 40 J = J + 1 50 GOTO 20	10 J = 1 20 IF J > N GOTO 60 30 Q(J) = P(J) 40 J = J + 1 50 GOTO 20	10 J = N 20 IF J = 0 GOTO 60 30 Q(J) = P(J) 40 J = J - 1 50 GOTO 20	10 J = N 20 IF J < = 0 GOTO 60 30 Q(J) = P(J) 40 J = J - 1 50 GOTO 20
10 J = 0 20 IF J = N GOTO 60 30 J = J + 1 40 Q(J) = P(J) 50 GOTO 20	10 J = 0 20 IF J > = N GOTO 60 30 J = J + 1 40 Q(J) = P(J) 50 GOTO 20	10 J = N + 1 20 IF J = 1 GOTO 60 30 J = J - 1 40 Q(J) = P(J) 50 GOTO 20	10 J = N + 1 20 IF J < = 1 GOTO 60 30 J = J - 1 40 Q(J) = P(J) 50 GOTO 20

Table 1: Twenty-four ways to write a loop in BASIC. These twenty-four basic methods can be expanded with a variety of small changes to produce over 124 different types of looping.

We can consider the possibility of setting $Q(J+1)$ to $P(J+1)$, or $Q(J-1)$ to $P(J-1)$, rather than $Q(J)$ to $P(J)$. In some cases, this would speed up some of the other operations in the loop. For example, at the top of the first column, we could have set J to 0 and tested J against N rather than $N+1$, if we set $Q(J+1)$ equal to $P(J+1)$. Both of these changes represent timing improvements.

It might seem that setting $Q(J+1)$ to $P(J+1)$ wastes a certain amount of time of its own, compared with setting $Q(J)$ equal to $P(J)$. This, however, is not so, or should not be so on a well-constructed system (although it might be so in some versions of BASIC). Any additive or subtractive constant in a subscript (such as $J+1$, above) does not have to be computed. To see why this is so, we need some knowledge of assembly language; those who know only BASIC may skip the following paragraph, in which the explanation is given.

Every time we make reference to $t(v)$, for an array t and a variable v , we have to add the value of v to the address of t . On the 8080, this is done explicitly; we typically do an `LXI H,t` followed by a `DAD D` where the `DE` register contains v (that is, where the `E` register contains v and the `D` register contains 0) and then we can reference $t(v)$ by doing `ADD M` or `MOV r,M` or `MOV M,r` or the like. On the 6502, it is done in the hardware; we do an `LDA t,X` or an `STA t,X` or an `ADC t,X` or the like, where the `X` register contains v , but the hardware adds the `X` register to the address given in the instruction, which effectively adds v to the address of t in this case. Every microcomputer has slightly different details, but the idea is the same in all cases. Now suppose we want to make a reference to $t(v+k)$, where k is a constant. We have to add the value of $v+k$ to the address of t — which is the same as adding the value of v to the address of t plus k . The point is

that both k and the address of t are constants; they do not change during the running of this program. Thus the address of t plus k is also a constant, and this addition can be done before the program starts. On the 8080, for instance, we would simply say `LXI H,t+k` rather than `LXI H,t`; this is a single instruction whose address field (second and third bytes of the instruction code) contains the 16-bit quantity obtained by adding k to the address of t . On the 6502, we might say `LDA t+k,X` and again we have a single instruction whose address field contains the address of t plus k . The same trick works, of course, for references to $t(v-k)$ rather than $t(v+k)$.

At any rate, by adding 1 or subtracting 1 in our subscripts, we have produced two new ways of writing a loop from every way we already have. We now have 108 ways to write a loop. Of course, theoretically, we could have set $Q(J+2)$ equal to $P(J+2)$, or $Q(J-2)$ equal to $P(J-2)$,

MT MicroSYSTEMS formerly MetaTech

and so on ad infinitum. There is now no bound at all (except for integer overflow considerations) on the number of new ways to write a loop we can set down.

One of these, by the way, has a certain amount of practical importance. The IM6100 microcomputer (or PDP-8) has an increment instruction, but no decrement instructions. Furthermore, the increment does a test against 0 (it is called ISZ, or increment and skip on 0). This does not correspond to anything in table 1 at all; if we are testing against 0, in table 1, we are always decrementing. However, consider the following loop:

```
10 J = -N
20 Q(J+N+1) = P(J+N+1)
30 J = J+1
40 IF J <> 0 GOTO 20
```

This time we cannot use the trick we mentioned earlier unless N is a constant. If N is a constant, however, the above loop does the same thing as all the other loops of table 1; and the last two instructions in it are meant to be executed, on the IM6100, by the single instruction ISZ J, followed by a jump to the label 20.

Are we finished with all possible speed improvements in our loop? Not at all. Consider the following loop:

```
10 J=2
20 Q(J-1)=P(J-1)
30 Q(J)=P(J)
40 J=J+2
50 IF J<=N GOTO 20
```

Suppose that N is 100. Then, instead of going through this loop one hundred times, we would go through it fifty times. Each time, *two* elements of the Q array would be set to corresponding elements in the P array. The advantage is that J=J+2 is done only fifty times, where J=J+1 was done one hundred times in the loops of table 1; also, the IF statement is done only fifty times instead of one hundred times.

In practice, the improvement here is not quite as good as it looks. The assignment J=J+2 is generally slower than J=J+1. In fact, on many microcomputers, the fastest way to do J=J+2 is to do J=J+1 twice. On the 6502, the two array assignments can be done very neatly, one after the other, with:

```
LDA P-1,X
STA Q-1,X
LDA P,X
STA Q,X
```

as soon as the value of J is in the X register. On the 8080, though, assuming that the address of P(J-1) is in DE and the address of Q(J-1) is in HL, you would have to do something like:

```
LDAX D
MOV M,A
INX D
INX H
LDAX D
MOV M,A
INX D
INX H
```

where the second INX D and INX H set up the DE and HL registers for the next time through the loop. Thus the only improvement here is in having fewer executions of the test at the end of the loop.

Obviously the same idea as above could be implemented by increasing the variable J by 3, by 4, or however many each time, although there will be a corresponding increase in the size of program memory. Another difficulty with these schemes is that they do not work unless J is a multiple of 2, or whatever the increment is. If this is not the case, then some extra elements will be transferred from one array to the other, and this may cause unpredictable results. The general technique (known as "unrolling" a loop) does, however, have some useful applications on big computers. Even on a small system it is often useful, particularly when N is a very small number, such as 3, to write:

```
10 Q(1)=P(1)
20 Q(2)=P(2)
30 Q(3)=P(3)
```

which is better than any of the loops we have so far discussed.

Another speed improvement in loops arises from an analysis of the case in which N=0. If we are moving N quantities, then, if N is 0, we should be moving no quantities; that is, we should be doing nothing at all. Many of our loops, however, either become endless, or they move a single quantity (P(1) or P(N)) in this case. In particular, this holds for all of the

loops in the first and third rows of table 1. The reason that this is a bit unsettling is that these are the only loops in table 1 which have three repeated statements in them (line numbers 20, 30, and 40). They are therefore the fastest of our loops, since all the other loops in table 1 have four repeated statements (line numbers 20, 30, 40, and 50).

It would seem that we have a choice between slowing down our loops and having a loop that doesn't work for N=0. In FORTRAN, in fact, the choice that was made was to disregard the case N=0 in favor of a faster loop. (This could be called an "institutionalized bug" in FORTRAN.) After all, the FORTRAN people reasoned, we can always check if N=0 just before starting the loop, if we are worried about this case. But there is a better way; we can write:

```
10 J=1
20 GOTO 50
30 Q(J)=P(J)
40 J=J+1
50 IF J <= N GOTO 30
```

thus having only three repeated statements (line numbers 30, 40, and 50) and a loop which works properly if N=0.

It might seem as if the above loop is violating a sacred precept by jumping into the middle of the loop (at line number 20). In fact, however, the problems associated with jumping into the middle of a loop do not apply to the special case of jumping to one of the incrementation and testing statements at the end of the loop, provided that we know what we are doing. (If we have a FOR loop in BASIC, we still can't jump from outside the loop to the NEXT statement at the end of it; we are merely talking about ways in which the FOR loop might be implemented.)

Let us now take up the general subject of implementation of loops in machine language.

In the first place, there are a few computers that perform certain loops in hardware. That is, there is a single instruction that performs an entire loop. On the Z80, the instructions LDIR, LDDR, CPIR, CPDR, INIR, INDR, OUTIR, and OUTDR are of this type. Single instructions that perform loops are also found on certain

big computers; thus the UNIVAC 1106 and other computers of the 1100 series have block transfer, search, and masked search instructions, and the now obsolete UNIVAC 1103 had a special instruction called "repeat" that caused the instruction which followed it to be repeated a specified number of times. The trouble with such instructions is that each of them is an implementation of only one specific type of loop, although an admittedly common one. For example, on the Z80, as long as the value of N is in the double register BC, we can perform the data-moving operation of table 1 by either of the sequences:

```
LD DE,Q
LD HL,P
LDIR
```

or:

```
LD DE,QEND
LD HL,PEND
LDDR
```

assuming that the arrays P and Q end at PEND and QEND respectively. (These two sequences correspond roughly to the second and fourth columns of table 1, respectively.) While this gives a significant speed improvement in this case, it is of no help if the repeated instruction, instead of $Q(J)=P(J)$, is $Q(J)=J$ or $Q(J)=0$ or $R(J)=P(J)+Q(J)$, or if the count could have been kept in the B register while the C register is used to hold something else. The same sort of thing could also be done in one instruction on the UNIVAC 1106, using a block transfer instruction.

In the second place, even if an entire loop cannot be executed by means of a single instruction, some microcomputers have a single instruction which performs the functions associated with the loop index — that is, increasing it or decreasing it by 1 and then performing a conditional transfer. On the Z80, there is DJNZ, which decrements the B register by one and jumps (presumably back to the start of the loop) unless the B register has been decreased to 0. On the Signetics 2650, there is BDRR, which does the same thing with any specified register; there is also BDRA, which performs a jump to an absolute rather than a relative address, and BIRR and BIRA, which increment in-

stead of decrementing. The EA9002's DRJ and IRJ are also similar. The 8080, the 6800, the 6502, and the COSMAC, however, have no instructions of this kind, although it is a technique very common on big computers.

Even though there may not be a single instruction on your processor that decreases a register by 1 and also does a conditional jump, this method of ending a loop is the one that is the most common on small systems. It corresponds to the loop at the top of the third column in table 1. Typically, you use the B register on the 8080 and 6800 and the Y register on the 6502. The decrementing instruction (DCRB on the 8080, DECB on the 6800, DEY on the 6502) sets the zero flag, so that a jump on nonzero (JNZ on the 8080 and BNE on the 6800 and 6502) can immediately follow. On the COSMAC, there is no zero flag; after decrementing, the register that was decremented must be moved to the D register before the branch on nonzero (BNZ).

One important difference between the typical loop and the one at the top of the third column in table 1 is that the movement of data in that loop proceeds backwards; that is, $Q(N)$ first, then $Q(N-1)$, and so on. In many loops the logic makes this impossible, and in any event it is unnecessary. Even if we have a register which decrements to 0 during a loop, we usually have one or more further indices which are initialized at the beginning of the loop and which increase, rather than decreasing, every time we start a new iteration.

Figure 1 illustrates the progress of such a loop. The loop moves the string DATA from one place to another in memory; it is given for the 8080 by:

```
LOOP: LDAX D
      MOV M,A
      INX D
      INX H
      DCR B
      JNZ LOOP
```

Figure 1: Progress through a loop to move the string "DATA" from one place in memory to another.

where the registers B, DE, and HL are presumed to be loaded before the loop starts. Specifically, register B is loaded with the number of characters to be moved (four, in this case); DE is loaded with the *source starting address*, or the address of the first character of the string in its old location; and HL is loaded with the *destination starting address*, or the address of the first character of the string in its new location. The six instructions of the loop are executed four times each, and the contents of the A, B, DE, and HL registers and the source and destination string area are illustrated. In the case of the DE and HL registers, an arrow is drawn from the register to the cell with address α , where the number α is currently in the given register. (We say that the register contains a *pointer* to that cell, or *points* to that cell.) The six instructions take 7, 7, 5, 5, 5, and 10 cycles respectively, giving a total

timing of $39n$ cycles for n characters to be moved; in this case it would be 156 cycles, or $78 \mu s$ if a 500 ns clock is used. To this must be added, of course, the time taken for initialization; using LXI D, α and LXI H, β and MVI B,4, the total time would become $93 \mu s$ in this case.

If you are new at writing assembly language code, do not worry if it takes you a while to get used to loops. Endless loops, and loops which are supposed to be done n times but which in fact are done either $n+1$ times or $n-1$ times, are quite commonly written by beginning programmers. The most important rules to remember are the following:

- When you jump back to the start of the loop, *never* jump back to the place where you set up the count or the starting addresses (registers B, DE, and HL in the example above). This will *always* result in

an endless loop. You should jump back to the point immediately following this initialization, as it is called.

- Remember that sometimes a loop must start with the count set to N, sometimes to N+1, and sometimes to N-1, depending on the logic. You should "walk through" your loops a few times when you are just starting out, until you are sure of the proper starting values.
- If you are using a step size greater than one, try not to test for equal or unequal. For example, if you are looping for J=1 to 10 by steps of two (FOR J=1 TO 10 STEP 2 in BASIC) then the values of J will be 1, 3, 5, 7, 9, 11, and so on; if your test at the end of the loop is a test for J=10, then J=10 will never hold and the loop will become endless. A test involving > or < (such as J <= 10) will avoid this difficulty. ■

Morse Code Trainer

Mark Bernstein
 Dept of Chemistry
 Harvard University
 Cambridge MA 02138

A commonly suggested application for microprocessors is translating text to Morse code. The subroutine described in figure 1 translates letters into Morse code and drives a speaker to serve as a Morse code trainer. Minor changes to the speaker driver routine would enable a microcomputer to key a transmitter directly.

The main entry to the routine is at hexadecimal address 0180. When the routine is called, the letter to be transmitted must be stored in register A as a number between decimal 0 and 25: 0=A, 1=B and 25=Z. By subtracting hexadecimal 41 from an ASCII letter code, this routine may be made compatible with ASCII text handling programs.

The program in listing 1 is relocatable. A data table (table 1) is expected to start at hexadecimal location 0080. The table may be relocated by changing the address stored in hexadecimal memory locations 0181 and 0182 to point at the location before the first word of the table.

Since the translation routine alters the contents of all registers, the user must write the mainline logic defensively. Registers containing important information must be saved by the user before calling the Morse code translator.

Intermediate Code

The heart of the Morse code translator is a binary representation of Morse code, illustrated in figure 2. This representation is stored in a data table for each letter, starting at hexadecimal 0080. The first letter's code is stored in the first position, the second letter's code in the next position, and so forth through the alphabet.

The intermediate code (stored as a binary coded decimal number) is very simple. The four high order bits define the number of dots or dashes in the letter. The four low order bits determine the sequence of dots and dashes for the letter. The first dot or dash is stored in the low order bit, with a 1 indicating a dash and a 0 indicating a dot.

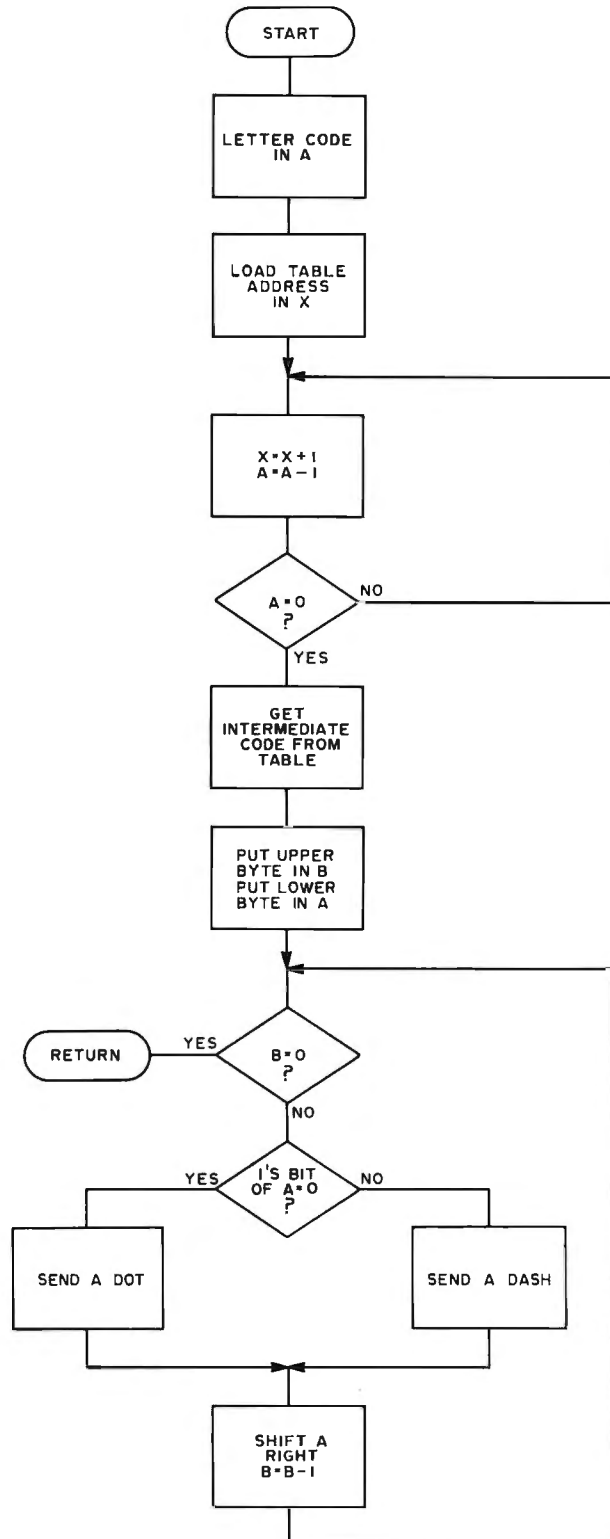

Figure 1: Flowchart for the Morse code translation routine.

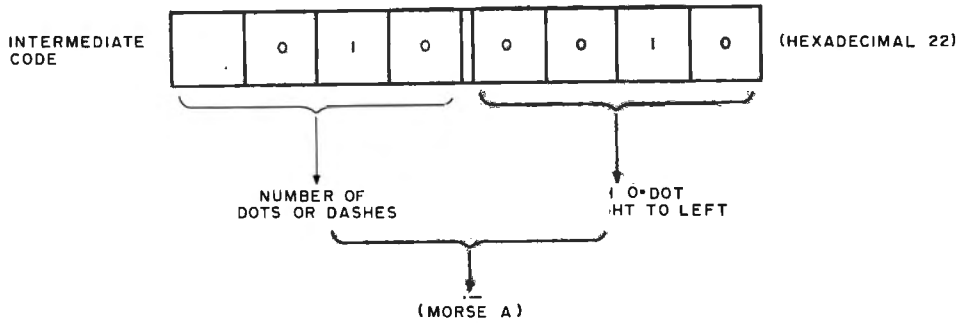

Figure 2: Intermediate code used by the ASCII-to-Morse-code translator. The data is stored in binary coded decimal (BCD) format. The high order bit indicates how many characters are in the letter; the low order bit defines whether they are dashes or dots.

Figure 3: Simple circuit for connecting a speaker to the computer output port for listening to computer output in Morse code.

Hexadecimal Address	Hexadecimal Code	Mnemonic Op Code	Operand	Comments
0178	16	TAB		entry for byte splitter
0179	84	OF		get low byte
017B	54	54	LSR	shift right four times
017D	54	54	LSR	to get high order byte
017F	39		RTS	
0180	CE	00 7F	LDX	main entry: point X to byte before start of data table
0183	08		INX	
0184	4A		DEC	A point X to Ath entry
0185	2A	FC	BPL	
0187	A6	00	LDA	A fetch intermediate code
0189	8D	ED	BSR	call byte splitter (0178)
018B	5D		TST	B all signals sent?
018C	26	01	BNE	
018E	39		RTS	all done
018F	85	01	BIT	A check lowest bit of A
0191	27	04	BEQ	jump if zero (dot)
0193	8D	08	BSR	send a dash
0195	20	02	BRA	skip
0197	8D	17	BSR	send a dot
0199	44		LSR	A shift A to get next signal code
019A	5A		DEC	B
019B	20	EE	BRA	start another pass through loop
019D	CE	20 00	LDX	load timer for a dash
01A0	0F		SEI	start tone here
01A1	09		DEX	
01A2	27	05	BEQ	all done?
01A4	7C	80 06	INC	increment PIA
01A7	20	F8	BRA	start a new loop
01A9	CE	10 00	LDX	start a pause after tone
01AC	09		DEX	loop for a while
01AD	26	FD	BNE	
01AF	39		RTS	tone finished
01B0	CE	10 00	LDX	load timer for a dot
01B3	8D	EB	BSR	go to tone generator
01B5	39		RTS	

The 2's bit gives the second dot or dash, if necessary, and so forth. For example, the code for A (- .) is hexadecimal 22 (0010 0010).

How it Works

The subroutine in listing 1 loads the index register with the starting address of the intermediate code table. The code indicated by register A is fetched, and the four high order bits are split off by a call to the subroutine at hexadecimal 0178 and stored in register B.

The low order bit of register A, which contains the code for a dot or dash, is now tested. If a dash is to be sent, the dash generator routine is called (hexadecimal 019B). A dot is handled by the dot generator routine (hexadecimal 01B0). These routines drive a speaker. They may be rewritten to drive a transmitter interface.

The speaker driving routines begin by setting a timing value into the index register. The values given in listing 1 (dot=1000, dash=2000) result in sending speeds of about seven words per minute on my computer using a 614 kHz clock speed. Different speeds and dot-to-dash ratios may be obtained by changing these values.

Listing 1: Morse code conversion program written in 6800 assembler code. This program can be relocated without any change.

The speaker is actually driven by the instruction sequence beginning at hexadecimal 01A0. This loop subtracts 1 from the index register and adds 1 to an output port. The use of a peripheral interface adapter (PIA) is assumed by this program. The address of the output port is stored in hexadecimal locations 01A5 and 01A6 until the X register is 0. The initial value of the X register determines the length of the tone. The program assumes that the appropriate output port has been initialized. By adding 1 to the output port each time the routine loops, the low order bit (PB0) changes very rapidly, the second bit (PB1) only half as quickly, and so forth; each bit gives a different tone. The speaker is connected to one output bit via a buffer, which provides sufficient drive capacity to power the speaker arrangement in figure 3. Users may select any bit to fit their own tonal preference.

After each dot or dash is sent, the main subroutine performs a logical shift right on register A. This places the next dot or dash code into the low order bit. Register B is decremented, and the program tests whether it is 0. If so, the entire letter has been sent. If register B is not 0, the program loops

until all dots and dashes have been sent. Control is then returned to the user's main-line program. ■

BYTE's Bits

Inexpensive Communications Via Meteor Trails

The hundreds of millions of meteors that enter the earth's atmosphere every day leave in their wake a very inexpensive communications medium — the meteor trail. This band of ionized particles is an effective alternative to satellites for communication. Meteor trails can be used to relay data on icebergs, pollution, earthquakes, oil reserves, and can link remote villages and distant sources of supplies and emergency assistance.

Meteor burst transmission has proven reliable and cost-effective for the snow telemetry program operated by the US Department of Agriculture's Soil Conservation Service. By transmitting snowfall data from remote locations, the program has

eliminated costly manual measurements.

Meteor burst transmission systems work in several stages. Remote sensors gather data while a microprocessor-controlled station emits a continuous radio signal, which bounces off a meteor trail whenever one occurs within range. When this signal reaches a transceiver at a remote site, data is transmitted via the meteor trail to the central station.

For more information, contact SRI International, 333 Ravenswood Ave, Menlo Park CA 94025.

Texas Instruments Has an Award Winning Bubble Memory

Texas Instruments has been awarded the 1979 Information Product of the Year Award for its Models 763 Bubble Memory Data

Terminal and 765 Portable Bubble Memory Data Terminal. Both terminals have a full 128-character alphanumeric keyboard. Up to 80,000 characters can be collected and stored in the nonvolatile bubble memory, then transmitted at rates from 110 to 9600 bits per second (bps) to a host computer system. Both units have a quiet 30 characters per second (cps) print speed and built-in acoustic couplers.

A bubble memory is a small electromagnetic circuit that stores digital information by changing the magnetic polarity of a thin, crystalline film. The bubbles are cylindrical magnetic islands polarized in a direction opposite from that of the film. Bubble memory has no moving parts, and, because it works magnetically, retains information when the power is turned off. It offers higher access speeds, smaller size, and less weight and power consumption over paper tape, cassette and floppy disk systems. Bubble memory

terminals can access any indexed record in memory in less than 15 ms — 10 times faster than on floppy disk. If the data location is unknown, the character string search speed is 1000 cps, about 4 times the speed of a cassette search.

For more information, contact Texas Instruments, POB 1444, M/S 7784, Houston TX 77001.

Coming up in BYTE

In the January 1980 issue of *BYTE*, the theme is "The Domesticated Computer" — the idea of using computers around the home in various forms. A key part of that theme is played by Steve Ciarcia's article (written with some research aid from Ira Rampil) on adapting a widely sold and mass-produced household electrical controller to the typical personal computer.

Thirty Days to a Faster Input

Arthur Armstrong
3345 Moore St
Los Angeles CA 90066

Remember the last time you typed something into your computer? Did you look at the text to find out what to type, then at the keyboard to find out how to type it, then at the screen to see what you had typed? If you did, then it's time you learned to touch type. This is simply a means of learning the positions of the keys so well that typing becomes unconscious and automatic, and the material seems to flow directly from your mind to the page. The mechanical process becomes completely removed from the cerebral process, much like a musician playing an instrument.

Learning touch typing is not difficult. (Consider the millions of people who have mastered it.) All it takes is a convenient and permanent assignment of fingers to keys, some way of measuring progress, and a lot of systematic practice. Fortunately for you, your computer can perform all the tedious error checking and bookkeeping while you concentrate on the process. The program listed at the end of this article will help you become, if not rich and famous, at least less frustrated in your typing.

Admittedly, the traditional keyboard is not an efficient one. However, if that is what

you have, you should use the conventional finger assignment shown in figure 1. Naturally, the keys work no matter what finger you use, but this scheme seems comfortable. The important thing is to always use the same finger for each key. Otherwise the process cannot become automatic.

The program will ask you what characters you want to practice. This allows you to learn groups rather than to attempt the entire keyboard at once. One good way is to start with the group ASDFG. When you have mastered these learn HJKL;. Then combine the entire row ASDFGHJKL;. (Use lower case if your keyboard makes this easier. Don't complicate things with the shift key until later.) As you type, keep the tips of the fingers resting on the "home" keys ASDF JKL;. This gives you a fixed reference for reaching other keys. After you have gained facility with the home row, use groups that will allow you to keep a reference on the home keys. Try groups like QWASZX or TYGHBN. This gives you practice in reaching up and down the board. If you try to learn each row separately, you will lose the sense of distance between rows.

The program then asks, "How many in each word?" This means how many of the characters from your group should be presented at one time. When starting a new group of keys, use a word length of one character. When you have learned the individual characters, increase the word length using the same group: this will allow you to develop rhythm. The time interval between keystrokes should always be the same, and don't worry about speed. If you work on accuracy and rhythm, the speed will develop. As you gain facility, use long word lengths (20 to 30) and include spaces in your groups. This gives a sense of typing sets of words.

Stereotyping

The program asks if you want "echo." This means do you want to see the letters you are typing. Perhaps it is better to use echo until you have gained confidence but your goal should be to type with no echo and without looking at the keyboard. If you find yourself peeking at the board use smaller groups of letters. Learn to type while looking only at the text you are copying.

Figure 1: Standard touch typing finger assignments for the conventional typewriter keyboard.

Notes On the Program	
Line Numbers	Commentary
100-130	Establishes the values for one set of trials. WL is word length. NT is number of trials. E is echo flag.
200-380	Constitutes the main loop presenting the trials. NP is the number of keystrokes possible.
220	Sets AS\$ to a null string. 230-260 select a random set of characters and form the word, AS\$, to be presented.
250	A catenation of strings. MID\$(CS\$,R,1) selects one character of CS\$ from position R.
270	Prints the word.
300-370	The input loop.
310	Gets one character from the keyboard (decimal ASCII, no parity).
315	Converts the value to a string.
320	Checks for echo and prints the character if echo is on.
350	Compares the input character with the appropriate character in the test word. If they are not the same, the program jumps to line 500 for error processing. If the character is correct, line 360 tallies the number right (NR) and 370 returns for the next input character.
375	Checks the echo flag and prints a new line if echo is on.
400-430	Presents the results of the trials. 400 calculates the percentage of correct keystrokes based on number right and number possible.
405-410	Tabulates the characters missed.
500-540	Keeps score on wrong characters. The missed character is in AS\$ pointed to by I. This character is compared with the characters in CS\$ using J as a pointer. When a match is found, line 515 tallies the miss in array A.
520	Tells you which character you missed.
530	A delay loop to allow time to respond to the error notice.
540	Goes back to the main loop for the next trial.

Listing 1: A BASIC program designed to teach touch typing. The user inputs the subset of typing characters to be used in the drill, and the program responds with random combinations of these characters. The user then attempts to duplicate this string of characters by touch typing only (ie: without looking at the keyboard). Any mistakes are immediately signalled by the computer, and the score is printed out. The program was written for MITS 3.2 BASIC and requires 8 K of programmable memory. Any BASIC package that features numeric arrays, strings, and a random number generation capability will suffice.

```

Listing 2: A sample touch typing program.

The program then asks, "How many trials?" This is the number of times the program will present you with a word before telling you your score.

After you have finished the set, the program will indicate your score and show you a tabulation of your errors. Note that the program checks each character as it is typed in. It doesn't wait for you to finish the word. As soon as you miss a character, the program tells you which one it was and gives you another word. This is to prevent learning wrong responses.

The program was written in MITS 3.2 8 K BASIC but should be easy to modify for other dialects if necessary.

One extension would be to modify the program to select words or phrases from DATA statements. This would allow you to practice on "real" words instead of random strings.

In any event, I hope this turns out to be your type of program! ■

SYSTEMS

C4P MF Personal Computer

Ohio Scientific has introduced the C4P MF computer which includes a 32 by 64 character display, a 24 K byte static random access memory which is expandable to 48 K bytes and two 5-inch floppy disks. The system features a line printer and modem interface, keyboard with lowercase, and software including a word processor and library of program development tools, high-speed animation, sound output, a digital-to-analog (D/A) converter for music and voice output, joystick interfaces, a home control operating system, an AC remote control interface, and a home security and fire alarm interface.

The price is \$1695. For further information, contact Nancy M Valent, Ohio Scientific, 1333 Chillicothe Rd, Aurora OH 44202.

Circle 578 on inquiry card.

System 8000 for Small Business

This microprocessor-based small system incorporates S-100 bus architecture and up to 64 K bytes of programmable memory. Called the System 8000, this product includes a Z80-based processor, a video terminal, a dot matrix printer, and a floppy disk subsystem ranging in storage from 180 K bytes to 2 M bytes. The video terminal has a 12-inch screen displaying 80 characters

on each of 24 lines. The printer has a 7 by 7 dot matrix with bidirectional printing capability and rear tractor feed. Software used by the System 8000 consists of the CP/M operating system with an interpreted or compiled BASIC language. Some of the software options include FORTRAN, COBOL and APL. For further information, contact Computer Markets, 75 the Donway W #910, Don Mills, Ontario, CANADA M3C 2E9.

Circle 579 on inquiry card.

Z80 Microprocessor-Based System

Informer 3's hardware consists of a Z80 microprocessor; 48 K bytes of programmable memory; two RS-232 serial interface ports; one parallel interface port; a software monitor in 2 K bytes of programmable read-only memory; 8-inch floppy disk; and a 24-line by 80-character video terminal. The software includes Floppy BASIC (an extended disk BASIC); diagnostics; and basic utilities, which include file copy and disk copy for either single or multiple drive systems. The business software includes inventory management, payroll, accounts payable and receivable, word processing, customer mailing list, general ledger, program development, and others.

The Informer 3 system sells for less than \$4000. For further information, contact Digital Sport Systems, Division of Rohner Machine Works, 7th and Elm, W Liberty IA 52776.

Circle 580 on Inquiry card.

What's New?

PERIPHERALS

Percom Adds Music Board to SS-50 Product Line

Percom Data Co has added the Newtech Model 68 Music Board to its SS-50 bus product line. The Music Board produces computer generated sounds such as melodies and rhythms, computer game sound effects, Morse code sounds, audible prompts for interactive computer operation, train sounds for model railroading, play-along and sing-along music, and sounds for many other applications.

The Music Board uses a single I/O (input/output) slot of Southwest Technical Products' 6800 computer and is supplied with a comprehensive user's manual that includes a theory of operation, a BASIC program for writing music scores, and an assembly language routine for program execution. The card includes address decoding, digital-to-analog conversion, audio amplification circuits, and its own speakers. The audio circuit includes a volume control.

An auxiliary jack for connecting the output audio to a remote speaker or audio system is mounted at the top of the card.

Also available, on either cassette or 5-inch disk, is *Americana Plus*, 14 tunes including "The Entertainer" and Chopin's "Minute Waltz." The cassette version of *Americana Plus* is compatible with Percom's CIS-30+ cassette and data terminal interface unit and the SwTPC AC-30 unit. The disk version runs on Percom's LFD-400 system using MINIDOS-PLUSX. The *Americana Plus* programs are in machine language and do not require an assembler or interpreter program.

The Music Board sells for \$59.95 assembled and tested. The cassette version of *Americana Plus* (MC-1SW) is priced at \$15.95, and the disk version (MD-1PC) is \$19.95. For further information, contact Percom Data Co, 211 N Kirby, Garland TX 75042.

Circle 533 on inquiry card.

Thermal Strip Printer

The Model STSP-1 is a serial thermal strip printer which responds to an ASCII input by printing uppercase 5 by 7 dot matrix characters on a narrow paper strip. Originally designed for use with portable battery-powered items, the control circuit uses CMOS integrated circuits for low power consumption. The mechanism has only one moving part, and the printing process is silent. The last fifteen characters can be easily seen

in the viewing area of the paper cassette. The parallel input port is at 5 V CMOS level. A busy line is provided to simplify interfacing.

The STSP-1 mechanism with control interface is priced at \$225; the STSP-1E mechanism with control interface, enclosure, power supply, and input cable sells for \$295; and a package of ten thermal print tape cassettes is \$25. For further information, contact Prentke Romich Co, RD 2, POB 191, Shreve OH 44676. Circle 535 on inquiry card.

Buffered Tabletop Teleprinter

Teletype Corp has announced a tabletop buffered teleprinter featuring a microprocessor-based controller. The

teleprinter comes with a send, edit and receive buffer, and with extensive user-activated options that make it attractive for a variety of applications. The tabletop Model 43 BSR (buffered send/receive) provides 16 K characters of solid-state storage. It can automatically send and receive data via its buffer at up to 180 characters per second. Simultaneously, data can be entered and edited off-line for future transmission.

The 43 BSR is designed for switched network timesharing and message switching applications where it can reduce transmission costs and computer connect time. The 43 BSR is also ideal for data base inquiry systems where several inquiries can be entered into the buffer off-line and then automatically sent to the host computer, which sends back information after each inquiry.

The price of the 132-column pin-feed teleprinter with 16 K buffer is \$2483. In an 80-column friction feed configuration, the price is \$2505. For further information, contact Teletype Corp, 5555 Touhy Ave, Skokie IL 60077.

Where Do New Products Items Come From?

The information printed in the new products pages of BYTE is obtained from "new product" or "press release" copy sent by the promoters of new products. If in our judgement the information might be of interest to the personal computing experimenters and homebrewers who read BYTE, we print it in some form. We openly solicit releases and photos from manufacturers and suppliers to this marketplace. The information is printed more or less as a first in first out queue, subject to occasional priority modifications. While we would not knowingly print untrue or inaccurate data, or data from unreliable companies, our capacity to evaluate the products and companies appearing in the "What's New?" feature is necessarily limited. We therefore cannot be responsible for product quality or company performance.

What's New?

PERIPHERALS

Disk Module Doubles Disk Storage of Vector Graphic Systems

A 630,000 character dual floppy disk module has been announced by Vector Graphic Inc, 31364 Via Colinas, Westlake Village CA 91361. Called MICRO-STOR, this unit is used to expand Vector Graphic MZ and Memorite II systems from 2 to 4 disk drives. The unit features 2 Micropolis MOD II quad-density disk drives in an attractive chassis, using the standard 5-inch, 16-sectored disk. The module simply plugs into the existing disk controller board. The operating systems presently in use on Vector Graphic hardware were prepared in advance to make use of 4 drives.

Tested and assembled, the MICRO-STOR is priced at \$1395.

Circle 525 on inquiry card.

Intelligent Printer Features 96-Character Set

The Trendcom 100 Intelligent Printer provides the microcomputer user with 40-column hard copy on 4½ inch (11.43 cm) wide paper. Interfaces are available for TRS-80, Apple II, PET and Sorcerer computers. The Trendcom 100 features bidirectional 40 character per second printing with a full 96-character ASCII set, including upper and lowercase letters, numerals, and punctuation marks. The 5 by 7 dot matrix characters are printed with either black or blue images, depending upon the paper used. The microprocessor-controlled unit is quiet, since it uses no print hammers, gears, or drive belts. This new printer uses a thick film thermal printhead to eliminate wear and reliability problems.

The Trendcom 100 is fully enclosed in a metal and high-impact plastic case and is available in both 115 V and 230 V AC versions. The printer is priced at \$375. For further information, contact Trendcom, 484 Oakmead Pky, Sunnyvale CA 94086.

Circle 526 on inquiry card.

Four Printers from Dataroyal

These versions of the IPS-7000 series feature a 9-wire print head, a 7 by 9 dot matrix with full lowercase descenders, a 96 American Standard Code for Information Interchange (ASCII) character set that prints at 200 characters per second, and includes an 8-bit microprocessor. Models 7048 and 7248 feature a 500-character circular buffer, and Models 7049 and 7249 offer a 3500 character buffer. The new models include programmable vertical format control, an audible alarm, and a self-test switch.

The 7048 serial and 7248 parallel models are \$1594, and the 7049 serial and 7249 parallel models are \$1669. For further information, contact Dataroyal Inc, Main Dunstable Rd, Nashua NH 03061.

New Terminal Supports Data Processing and Word Processing Applications

The Hazeltine 1420 computer terminal is designed to support small business systems using both data and word processing software. It features a typewriter-style keyboard arrangement with both upper and lowercase, making

it suitable for fast and accurate entry, and high-intensity blink or nondisplay (zero intensity) modes.

The terminal also features a program-function key mode as well as column and field tabs. All of the basic elements needed for up-to-date, fast data entry and data inquiry are included in the video terminal, including an enhanced separate numeric keypad. The Hazeltine 1420 operates with a standard EIA RS-232 interface with eight transmission rates up to 9600 bits per second (bps) which are switch selectable and accommodate all 128 ASCII codes.

The microprocessor design of the terminal permits utilization of fewer parts and increases its dependability. Its state-of-the-art design results in cool operating temperatures and makes possible the elimination of a fan.

For further information, contact Hazeltine Corp, Computer Terminal Equipment, Greenlawn NY 11740.

What's New?

PERIPHERALS

Add-on Disk Drives for TRS-80

A family of add-on disk drives for the TRS-80 has been introduced by Microcomputer Technology Inc, 2080 S Grand Ave, Santa Ana CA 92705. The MTI single-head disk drive family (TF-X) offers the user a choice of MPI, Pertec, or Shugart SA400 5-inch floppy disk drives. The Shugart drive is the same device offered by Radio Shack, while the Pertec provides quieter operation and the use of both sides of the disk. The MPI unit provides additional features normally found in the 8-inch size disk drives, such as door lock and automatic disk ejection.

Prices for the TF-X single-head units start at \$379. MTI's dual-headed units (TDH-X) provide the same capacity as two single-headed drives and are priced at \$675.

Light Pen for Radio Shack TRS-80

This self-contained light pen which plugs directly into the TRS-80 bus con-

Pen Plotter with Built-in Microcomputer-Based Controller

The Model 1553 is a compact, portable, desktop Digital Incremental Plotter with an integral microcomputer-based controller. The built-in RS-232 interface provides for on-line, off-line or remote operation via communication

lines, as a timeshared terminal.

The unit's high speed (10 inches per second (ips) along axes, 14.14 ips diagonal movement) and the intelligence of the controller (hardware symbol and character generation, circle and arc generation, dot and dash generation, scale and rotate), make it suited for business graphics, process control and scientific analysis plotter applications. The resolution is 0.0025 inch for excellent line quality. A universal pen holder and dynamic adjuster allow the use of ballpoint, liquid roller, and fiber tip pens. Pen type and color changes can be accomplished easily during a plot through programmable plotter pause commands.

The price of the Digital Incremental Plotter is \$5950. For further information, contact Nicolet Zeta Corp, 2300 Stanwell Dr, Concord CA 94520.

Circle 531 on inquiry card.

Microprocessor-Based Cassette Terminal Features NCR Compatibility

This NCR-compatible, microprocessor-based cassette terminal is for applications including data communications, data logging, and program loading. The MFE Model 5450VRL Microprocessor Cassette Terminal is an 8080-based data storage system that features an optional variable record length read capability for compatibility with NCR's variable block length systems. The standard 5450 is compatible with Sweda, Texas Instruments, and all other RS-232-compatible systems. Accommodating ANSI/EMCA-compatible cassettes, all MFE terminals automatically perform read after write, cyclic redundancy check, and parity error checks to insure data integrity.

The storage capacity for the MFE 5450VRL varies with record length; for the 5450, capacity is 442 K formatted characters. The MFE product line also includes the Model 5000 (221 K characters), and the 2500 (350 K characters). All, except the 2500, incorporate high-speed skip, search, and edit capability. The terminals operate in full and half duplex modes; full duplex provides echoplex operation for each character. Dual RS-232C I/O (input/output) interfaces are standard; 20 mA current loop is optional.

MFE Microprocessor Cassette Terminals are priced from \$1995 each for the 5000 and 5450, and from \$1190 for the 2500; the VRL option for the 5450 is \$200. For further information, contact MFE Corp, Keewaydin Dr, Salem NH 03079.

Circle 532 on inquiry card.

necter has been announced by the 3G Company Inc, Rt 3, POB 28a, Gaston OR 97119. The light pen makes it possible to bypass the TRS-80's keyboard and interact directly with the information displayed on the video screen. The light pen adds versatility to most graphics programs and makes possible unique games. A menu can be displayed on the screen, and the user can make a selection from that menu by using the light pen. This type of interaction makes it easy for the person who is not familiar with computers to use an applications program.

The light pen is completely assembled and ready to plug into the TRS-80. A sample program and programming instructions are included with the pen. The light pen sells for \$34.95 plus \$1.50 for postage and handling within the US (\$6 for foreign orders). The pen includes a 30-day unconditional money back guarantee.

Circle 530 on inquiry card.

What's New?

PERIPHERALS

Miniature Printer Prints Text and Graphics

Called the ESP-40, this miniature printer can print images transmitted by digital facsimile equipment or can be used with any keyboard to form a low-cost printer terminal. The ESP-40 utilizes a nonimpact matrix printing process, and prints on electrosensitive paper 4 inches (10.16 cm) wide at rates up to

280 characters a second. A built-in microprocessor with a 320-character buffer memory enables the unit to print upper and lowercase characters (7 or 9 dots high) in a variety of styles and widths under program control. Between 5 and 20 characters per inch can be printed, and characters of different widths can be printed on the same line.

For plotting diagrams, the buffer output is applied directly to the printhead.

This enables up to 8 vertical dots to be printed at 240 printhead positions across the width of the paper, and in this mode the line shift is 8 dots high. The unit can plot curves and circles with great accuracy, and produce maps, drawings, and copies of photographs as well as diagrams. The printing mechanism is controlled by a timing disk which synchronizes the printhead with the data buffer. This ensures that the quality of printing is unaffected by changes in voltage or in mechanical friction.

The ESP-40 is 8 by 8.3 by 4.1 inches (20.32 by 21.08 by 10.41 cm) without the cooling fan. An electronic watchdog monitors all functions and sounds an alarm in case of impending or actual failure. Used with a hand-held keypad, test routines for fault diagnosis are provided by the on-board software. For further information, contact English Numbering Machines Ltd, Printer Div, Queensway, Enfield EN3 4SB, Middlesex, ENGLAND.

Circle 536 on Inquiry card.

New Terminal Fully Compatible with DEC VT-100

The DT80/1 video terminal offers full compatibility with Digital Equipment Corporation's VT-100. A key feature of the DT80/1 is its ability to interface with a printer in three different modes: on-line as data arrives; as a printer controller; and as a source for feeding data from the screen directly to the printer. The terminal offers a special display tube saver and self-diagnostics, and is protected by a one-year warranty.

For optimum space flexibility, the DT80/1 has a detachable keyboard. The capacity of its video screen is 24 lines by 80 or 132 characters, with light-emitting diode indicators for operator awareness and status. The DT80/1 screen also offers such functions as underline, blink, and dual-intensity. In addition, the user may employ a split screen, double-high

or double-wide characters, composite video input and output, and limited graphics. Reverse video is also keyboard selectable.

Other user convenience features include a typewriter-style keyboard, fixed and settable tabs, and bidirectional smooth scrolling. Internally, the DT80/1 houses a large-scale integrated technology video controller with two serial I/O (input/output) ports, which operate asynchronously with either RS-232C or 20 mA current loop. Communication speeds are up to 19,200 bits per second (bps).

For more information, contact Datamedia Corp, 7300 N Crescent Blvd, Pennsauken NJ 08110.

Circle 537 on Inquiry card.

New Printers from Centronics

Centronics printers, Models 730-1 through 730-7, include such features as 50 character per second print speed, 80 column line length at 10 characters per inch (3.9 characters per cm), a full line buffer, high-speed carriage return, and 7 by 7 dot matrix printing. Each unit has a built-in tear bar for paper tear off within five lines of print and is capable of making three simultaneous copies.

The printers' typewriter-like platen takes hand fed 8.5 inch (21.6 cm) wide sheets in letter, legal size or longer lengths, standard international sized A4 sheets, and the fixed pins on the platen accept standard computer grade multipart or single-part fanfold paper 9 inches (23 cm) wide from pin-to-pin. This system also allows the use of 8.5 inch (21.6 cm) wide roll paper up to 5

inches (12.7 cm) in diameter.

The Model 730s can handle payroll checks on preprinted forms, inventory listings on computer-grade fanfold paper, direct-mail letters on cut sheets and general information on roll paper. Some other applications include electronic mail, message logging, technical and scientific data logging and reservation systems.

These units weigh less than 10 pounds (4.5 kg) and measure 14.5 inches (36.8 cm) wide by less than 12 inches (30.5 cm) deep and less than 5 (12.7 cm) inches tall. The parallel printers are \$995 and the serial printers are \$1045. Contact Chuck Clemente or Sterling Hager at Centronics, Hudson NH 03051.

What's New?

SOFTWARE

Pascal Business Software

A fully integrated system of Pascal business accounting packages has been announced by PS inc, Fargo ND. Standardized on the UCSD implementation of the language, the software includes a general ledger package that permits a company to name and number over 1000 of its own accounts, and to generate financial reports for the overall operation and for separate profit

centers. Accounts payable with aging and cash requirements reporting; accounts receivable with aging and sales analysis; order entry; and inventory control are all tied into the general ledger. It is menu-oriented for ease of training and use.

PS inc can supply their software on floppy disk or cartridge disk media.

For more information, contact PS inc, 619 NP Ave, Fargo ND 58102.

Circle 551 on inquiry card.

Development and Debugging Software for 6800 Micro-computer Programming

Percom Data Co has expanded its 6800 microcomputer software products line to include additional support programs for use in program development and debugging. The six programs that have been added include an assembler-linking loader, three disassemblers, a relocater, and a monitor with debugging conveniences. The programs are available on either cassette or disk, except the monitor which is in erasable read-only memory. Cassettes are Kansas City standard format at 300 bits per second (bps). The programs work with Percom operating systems. For prices and detailed description of the programs, write to Percom Data Co, 211 N Kirby, Garland TX 75042.

Circle 554 on inquiry card.

Macroassembler and Text Editor for PET, Apple II or SYM

The 6502 Macroassembler and Text Editor (ASSM/TED) is written specifically for the PET, Apple II, and SYM microcomputers. This software package was written in assembly language and occupies 8 K bytes of memory starting at hexadecimal location 2000. ASSM/TED provides 27 commands and 20 pseudo operations. Specific features include macroinstructions and conditional assembly support;

extensive text editing commands (which include automatic line numbering, and string search and replace); tape load; record and append commands; vectors for interfacing to disk systems; free format source input; source-code syntax similar to MOS Technology specifications, and other functions.

The user manual and cassette tape in either PET, Apple II or SYM (HS) format are available for \$35 plus \$2 for shipping and handling. For further information, contact C W Moser, 3239 Linda Dr, Winston-Salem NC 27106.

Circle 552 on inquiry card.

Software Packages for the UCSD Pascal Operating System

Two new software packages are available for the UCSD Pascal operating system. The first package, FORMOUT, is a collection of routines to do formatted output from Pascal programs. Included routines allow formatted printing of strings and numbers, tabbing to a specific column, and printing an arbitrary number of spaces or some other printing character. FORMOUT allows the user to easily switch from one I/O (input/output) device to another so that programs can be switched between devices during processing.

CPMREAD, the second package, translates CP/M disk files to Pascal text files. It allows the user to investigate the CP/M disk directory and choose the files to be translated. Assembler and BASIC source code can be brought across and then modified for use on the Pascal system using the standard Pascal editors. Since CPMREAD is written completely in Pascal, it can run on any machine running the UCSD Pascal system, allowing LSI-11 (and other) systems to have access to CP/M files.

FORMOUT is available as a source listing with manual for \$20. A machine-readable copy of FORMOUT is available on an 8-inch soft-sectored, single-density disk, for an additional \$10. CPMREAD is distributed as an executable code file only and is available for \$25. For further information, contact Pickles and Trout, POB 1206, Goleta CA 93017.

Circle 555 on inquiry card.

Pascal for North Star Horizon

North Star Computers Inc has announced that Pascal is now available for use with the North Star Horizon computer and Micro Disk System (MDS). North Star Pascal incorporates the complete UCSD Pascal program development system. North Star's version of Pascal includes such standard language features as the four elementary data types: real and integer numbers, boolean (true and false), and char (characters). The programmer may also define custom data types. Both elementary and programmer-defined data types may be organized into arrays, records, sets, or sequential files.

Pascal programs are easily understandable since descriptive names may be given to variables, constants, procedures, and functions within a program. Several types of loops and two conditional statements are provided to control program execution. A restricted form of GOTO is also available. In addition, North Star Pascal includes several extensions which ease the task of writing major business and personal programs.

The North Star Pascal package includes its own operating system. Pascal programs are compiled into fast executing p-code and are executed at

runtime by a program which simulates the operation of a hypothetical computer called the P-machine. The program development system is available on two single-density 5-inch disks or one double-density disk. Software provided with the system includes the P-machine simulator, Pascal operating system, Pascal compiler, and a screen-oriented text editor. A line-oriented text editor is also included with the system for use in situations where a suitable video terminal is not available.

For advanced applications, an auxiliary Pascal software package is available, containing a special assembler and numerous utility programs. With the assembler, it is possible to generate machine code procedures and functions which may be linked into compiled Pascal programs prior to execution. The auxiliary Pascal software package supplements the primary package described above.

The primary North Star package is \$49 including reference manual. The auxiliary software package is available for \$29. In ordering either package, specify whether single-density or double-density disk operation is desired. The system documentation package alone may be ordered for \$20. For further information, contact North Star Computers, 2547 Ninth St, Berkeley CA 94710.

Circle 553 on inquiry card.

What's New?

SOFTWARE

Tiny Pascal for TRS-80

A compact version of Tiny Pascal fits in the standard 16 K byte TRS-80 system and consists of the compiler, text editor, runtime routines, p-code interpreter (which saves storage space), and a system monitor. Execution speed is about 4 times faster than Level II BASIC using integer variables. This version is available from SuperSoft, POB 1628, Champaign IL 61820 for \$40.

Circle 556 on inquiry card.

Software for Texas Instruments

This software system is written in BASIC, works on floppy and hard disk systems and includes inventory control, order entry, sales analysis, general ledger, accounts payable, accounts receivable, and payroll.

Some of the capabilities of this software include invoice printing; back order reports; sales analysis by salesmen, customer, and product; purchase order journals and much more.

This system works on the Texas Instruments 990 and 771 computers. It is available from Kitzmiller Systems, 252 S Oxford Ave, Los Angeles CA 90004.

Circle 557 on inquiry card.

Digital Research Introduces CP/M 2.0 and MP/M

Digital Research has announced two new disk operating systems that are adaptable to nearly any 8080 or Z80 computer system with disk backup storage. CP/M 2.0, an enhanced version of CP/M, release 1, can run simple floppy disk systems to large-capacity hard disk drives. Configuration is accomplished through a disk definition table which drives the file management algorithms, allowing simple field alteration.

MP/M is a CP/M compatible multiterminal operating system which supports real-time multiprogramming at each terminal, along with background and foreground modes. It can serve as a complete program development environment for one or more users, or as the nucleus of clustered terminals or processors accessing a common data base. MP/M device drivers can be altered in the field to operate with interrupt driven or polled I/O (input/output) devices.

CP/M 2.0 is \$150 and MP/M is \$300, which includes documentation and floppy disk in single-density 8-inch form. Contact Digital Research, POB 579, Pacific Grove CA 93950.

Circle 558 on inquiry card.

8080 Simulator and Debug Package for Apple II

The Apple-80 is an 8080 simulator and debug package designed for the 6502-based Apple II computer. It allows any 16 K byte or larger Apple II to run programs written for the 8080, and can be used as a design and debugging aid for the development of original 8080 software.

Apple-80 provides single step, trace, and run modes, and executes all valid 8080 op codes. Illegal op codes are rejected. All 8080 registers are visible on the Apple screen and may be modified at will. 8080 I/O (input/output) port addresses are arranged in a table for ease of user modification. Up to eight

breakpoints may be set to facilitate program debugging. 6502 subroutines may be called directly from 8080 programs, allowing full access to Apple monitor and user-written functions. Conversely, 8080 routines may be embedded in 6502 programs. Vectored interrupts are also simulated.

The complete Apple-80 package includes Apple-80 routines, a manual, an 8080 program which demonstrates Apple-80 features, and an Apple-80 ready-reference card. The package is priced at \$20 plus \$1.50 for shipping and handling. For further information, contact Dann McCreary, POB 16435-B, San Diego CA 92116.

Circle 559 on inquiry card.

Text Output Processor

Script-80 is an 8080 microcomputer-based text output processing program that is compatible with the Script text processors available on most large mainframe computers. Developed to handle form letters, document files, and mailing lists, Script-80 requires an 8080 or Z80-based microcomputer with at least 16 K bytes of memory, a printer or hard copy terminal, a floppy disk drive, and CP/M or a compatible (CDOS, IMDOS, etc) operating system. The Script-80 system supports over 50 standard Script commands for the combining of multiple files, formatting and right-justifying of text, margin and line length control, centering of title lines, spacing, immediate and conditional page eject, page headings, page footings, and several formats of page numbering. Text from up to 255 files may be nested and embedded in the output text as though they are a

part of the original file. Additional features include picture (pixel) processing, automatic multidisk search for embedded files, and extended upper and lowercase conversion capabilities.

The Script-80 Professional version extends page, multiple disk, and output device handling. The user's manual explains how to use Script-80 with BASIC for selective mailing of form letters. The Commercial version goes beyond the Professional version to support mass personalized-letter mailing techniques.

The single-drive Hobbyist version is \$45; the multidrive Professional version sells for \$125; the full Commercial version with two-year update and maintenance service is \$625; the manual alone (specify version) is priced at \$25. For further information, contact J Vilkaitis Consultants, POB 26, 417 High St Ext, Thomaston CT 06787.

Circle 560 on inquiry card.

Apple Releases New Software

Apple Computer Co has released volumes 3 through 5 of the *Apple Software Bank*, a library of user-contributed programs. The new programs include File Cabinet, a personal directory and record keeping system; Character Generator, a program to label high-resolution graphic images; California Driver's Test, (a simulation of the actual exam); Integer Basic Renumber/Append; and 25 others.

Accompanying the 3 new volumes is a 90-page manual providing detailed descriptions and operating instructions for each of the programs. Called the *Bonus Issue*, the manual is an effective aid for Apple II users trying to establish or improve good programming techniques.

Apple also introduced 2 new graphics-oriented games, Apple Bowl and

Microchess. Both games use high-resolution graphics. Apple Bowl creates a life-like simulation of bowling, including ball speed and spin control capabilities to help bowlers perfect their games. Microchess is a strategy game and includes 8 levels of ability, from which the user can select the one most closely matching their playing skill.

The *Apple Software Bank* user-contributed programs are available from Apple dealers. Users must provide their own blank disk or cassette tape for copying the programs. A copy fee of \$10 per disk or \$2 per program is charged. The *Bonus Issue* manual is free with the purchase of all or any programs. Microchess is priced at \$20 on cassette and \$25 on disk, and Apple Bowl is priced at \$20 on cassette or disk. For further information, contact Apple Computer Inc, 10260 Bandlely Dr, Cupertino CA 95014.

MICRO-PROCESSORS: FROM CHIPS TO SYSTEMS

This book cover all aspects of microprocessors, from the basic concepts to advanced interfacing techniques, in a progressive presentation. It is independent from any manufacturer, and presents uniform **standard** principles and design techniques, including the interconnect of a **standard** system, as well as specific components. It introduces the MPU, how it works internally, the system components (ROM, RAM, UART, PIO, others), the system interconnect, applications, programming, and the problems and techniques of system development. By R. Zaks. SYBEX. Ref. C201. \$9.95

MICRO-PROCESSOR INTERFACING TECHNIQUES

Microprocessor interfacing is no longer an art. It is a set of techniques, and in some cases just a set of components. This comprehensive book introduces the basic interfacing concepts and techniques, then presents in detail the implementation details, from hardware to software. It covers all the essential peripherals, from keyboard to floppy disk, as well as the standard buses (S100 to IEEE 488) and introduces the basic troubleshooting techniques. (2nd Expanded Edition). By Austin Lesea and R. Zaks. Ref. C207 SYBEX. \$11.95

PROGRAMMING THE 6502 PROGRAMMING THE Z80 PROGRAMMING THE 8080*

It covers all essential aspects of programming, as well as the advantages and disadvantages of the 6502 and should bring the reader to the point where he can start writing complete applications programs. For the reader who wishes more, a companion volume is available: The 6502 Applications Book. By R. Zaks. 6502: Ref. C202; Z80: Ref. C280; 8080: Ref. C208. SYBEX. Each \$10.95

44 BUS MOTHER BOARD

Has provisions for ten 44 pin (.156) connectors, spaced 3/4 of an inch apart. Pin 20 is connected to X, and 22 is connected to Z for power and ground. All the other pins are connected in parallel. This board also has provisions for bypass capacitors. Board cost \$15.00 Part No. 102. Connectors \$3.00 each Part No. 44WP.

AN INTRODUCTION TO PERSONAL AND BUSINESS COMPUTING

No computer background is required. The book is designed to educate the reader in all the aspects of a system, from the selection of the microcomputer to the required peripherals. By Rodney Zaks. Ref. C200. SYBEX \$6.95

TVT COOKBOOK

Bk 1064 — by Don Lancaster. Describes the use of a standard television receiver as a microprocessor CRT terminal. Explains and describes character generation, cursor control and interface information in typical, easy-to-understand Lancascaster style. \$9.95

COMPUTER PROGRAMMING HANDBOOK

A complete guide to computer programming & data processing. Includes many worked-out examples. By Peter Staak. TAB \$9.95

DIGITAL CASSETTE

5 min. each side. Box of 10 \$9.95. Part No. C-5.

To Order: Mention part no. description, and price. In USA shipping paid by us for orders accompanied by check or money order. We accept C.O.D. orders in the U.S. only, or a VISA or Master Charge no., expiration date, signature, phone no., shipping charges will be added. CA residents add 6.5% for tax. Outside USA add 10% for air mail postage and handling. Payment must be in U.S. dollars. Dealer inquiries invited. 24 hour order line (408) 448-0800

Send for FREE Catalog . . . a big self-addressed envelope with 41¢ postage gets it fastest!

ELECTRONIC SYSTEMS Dept. B P. O. Box 21638, San Jose, CA USA 95151

COMPUCRUISE

Put a computer in your car, which gives you the most effective and functional cruise control ever designed, plus complete trip computing, fuel management systems, and a remarkable accurate quartz crystal time system. So simple a child can operate, the new CompuCruise combines latest computer technology with state-of-the-art reliability in a package which will not likely be available on new cars for years to come • Cruise Control • Time, E. T., Lap Timer, Alarm • Time, Distance, Fuel to Arrival • Time, Distance, Fuel to Empty • Time, Distance and Fuel on Trip • Current or Average MPG, GPH • Fuel Used, Distance since Fillup • Current and Average-Vehicle Speed • Inside, Outside or Coolant Temperature • Battery Voltage • English or Metric Display. \$199.95, without cruise control \$159.95.

FLOPPY DISK STORAGE BINDER

This black vinyl three-ring binder comes with ten transparent plastic sleeves which accommodate either twenty, five-inch or ten, eight-inch floppy disks. The plastic sleeves may be ordered separately and added as needed. A contents file is included with each sleeve for easy identification and organizing. Binder & 10 holders \$14.95 Part No. B800; Extra holders 95¢ each. Part No. 800

OPTO-ISOLATED PARALLEL INPUT BOARD FOR APPLE II

There are 8 inputs that can be driven from TTL logic or any 5 volt source. The circuit board can be plugged into any of the 8 sockets of your Apple II. It has a 16 pin socket for standard dip ribbon cable connection. Board only \$15.00. Part No. 120, with parts \$69.95. Part No. 120A.

TIDMA

• Tape Interface Direct Memory Access • Record and play programs without bootstrap loader (no prom) has FSK encoder/decoder for direct connections to low cost recorder at 1200 baud rate, and direct connections for inputs and outputs to a digital recorder at any baud rate • S-100 bus compatible • Board only \$35.00 Part No. 112, with parts \$110 Part No. 112A

SYSTEM MONITOR

8080, 8085, or Z-80 System monitor for use with the TIDMA board. There is no need for the front panel. Complete with documentation \$12.95.

16K EPROM

Uses 2708 EPROMS, memory speed selection provided, addressable anywhere in 65K of memory, can be shadowed in 4K increments. Board only \$24.95 part no. 7902, with parts less EPROMs \$49.95 part no. 7902A.

ASCII KEYBOARD

TTL & DTL compatible • Full 67 key array • Full 128 character ASCII output • Positive logic with outputs resting low • Data Strobe • Five user-definable spare keys • Standard 22 pin dual card edge connector • Requires +5VDC, 325 mA. Assembled & Tested. CherryPro Part No. P70-05AB. \$119.95.

ASCII KEYBOARD

53 Keys popular ASR-33 format • Rugged G-10 P.C. Board • Tri-mode MOS encoding • Two-Key Rollover • MOS/DTL/TTL Compatible • Upper Case lockout • Data and Strobe inversion option • Three User Definable Keys • Low contact bounce • Selectable Parity • Custom Keycaps • George Risk Model 753. Requires +5, -12 volts. \$59.95 Kit.

ASCII TO CORRESPONDENCE CODE CONVERTER

This bidirectional board is a direct replacement for the board inside the Trendata 1000 terminal. The on board connector provides RS-232 serial in and out. Sold only as an assembled and tested unit for \$229.95. Part No. TA 1000C

DISK JACKET™

Made from heavy duty .0095 matte plastic with reinforced grommets. The mini-diskette version holds two 5-1/4 inch diskettes and will fit any standard three ring binder. The pockets to the left of the diskette can be used for listing the contents of the disk. Please order only in multitudes of ten. \$9.95/10 Pack.

ATARI 800

Computer with 8K \$995.00, disk drive \$549.00, printer \$599.99

VIDEO TERMINAL

16 lines, 64 columns • Upper and lower case • 5x7 dot matrix • Serial RS-232 in and out with TTL parallel keyboard input • On board baud rate generator 75, 110, 150, 300, 600, & 1200 jumper selectable • Memory 1024 characters (7-21L02) • Video processor chip SFF96364 by Neculonic • Control characters (CR, LF, →, ←, ↑, ↓, non destructive cursor, CS, home, CL • White characters on black background or vice-versa • With the addition of a keyboard, video monitor or TV set with TV interface (part no. 107A) and power supply this is a complete stand alone terminal • also S-100 compatible • requires +16, & -16 VDC at 100mA, and 8VDC at 1A. Part No. 1000A \$199.95 kit.

RS-232/20mA INTERFACE

This board has two passive, opto-isolated circuits. One converts RS-232 to 20mA, the other converts 20mA to RS-232. All connections go to a 10 pin edge connector. Requires +12 and -12 volts. Board only \$9.95, part no. 7901, with parts \$14.95 Part No. 7901A.

COMPUCOLOR II

Model 3, 8K \$13.95, Model 4, 16K \$15.95, Model 5, 32K \$18.95. Prices include color monitor, computer, and one disk drive.

PET COMPUTER

With 32K & monitor - \$1195. Dual Disk Drive - \$195.

Apple II or APPLE II PLUS

16K - \$979, 32K - \$1059, 48K - \$1123. Disk & cont. \$589

CASSETTE TAPE ERASER

REMOVES RECORDINGS IN ONE SECOND! The process eliminates static positive / negative ions and maintains original tone quality with minimal tape hiss • To improve tone quality • To reduce hissing • For quick and easy to erase • No battery or liquid required • Powerful and effective action • Unconditional 2 year guarantee. ERASER-8 \$19.95.

16K RAMS

For the Apple. TRS-80 or Pet \$8 each Part No. 4116/2117.

APPLE II HOBBY/PROTOTYPING CARD

\$14.95 Part No. 7907

T.V. INTERFACE

• Converts video to AM modulated RF. Channels 2 or 3. So powerful almost no tuning is required. On board regulated power supply makes this extremely stable. Rated very highly in Doctor Dobbs' Journal. Recommended by Apple • Power required is 12 volts AC C.T. or +5 volts DC • Board only \$7.60 part No. 107, with parts \$13.50 Part No. 107A

PARALLEL TRIAC OUTPUT BOARD FOR APPLE II

This board has 8 triacs capable of switching 110 volt 6 amp loads (660 watts per channel) or a total of 5280 watts. Board only \$15.00 Part No. 210, with parts \$119.95 Part No. 210A.

To Order: Mention part no. description, and price. In USA shipping paid by us for orders accompanied by check or money order. We accept C.O.D. orders in the U.S. only, or a VISA or Master Charge no., expiration date, signature, phone no., shipping charges will be added. CA residents add 6.5% for tax. Outside USA add 10% for air mail postage and handling. Payment must be in U.S. dollars. Dealer inquiries invited. 24 hour order line (408) 448-0800

Send for FREE Catalog . . . a big self-addressed envelope with 41¢ postage gets it fastest!

ELECTRONIC SYSTEMS Dept. B P. O. Box 21638, San Jose, CA USA 95151

TRS-80^{E.S.} SERIAL I/O

- Can input into basic
- Can use LLIST and LPRINT to output, or output continuously
- RS-232 compatible
- Can be used with or without the expansion bus
- Onboard switch selectable baud rates of 110, 150, 300, 600, 1200, 2400, parity or no parity odd or even, 5 to 8 data bits, and 1 or 2 stop bits. D.T.R. line
- Requires +5, -12 VDC
- Board only \$19.95 Part No. 8010, with parts \$59.95 Part No. 8010A, assembled \$79.95 Part No. 8010C. No connectors provided, see below.

EIA/RS-232 connector Part No. 0825P\$6.00, with 9' 8 conductor cable \$10.95 Part No. 0825P9

3' ribbon cable with attached connectors for TRS-80 and our serial board \$19.95 Part No. 3CAB40.

MODEM

- Type 103
- Full or half duplex
- Works up to 300 baud
- Originate or Answer
- No coils, only low cost components
- TTL input and output-serial
- Connect 8 Ω speaker and crystal mic. directly to board
- Uses XR FSK demodulator
- Requires +5 volts
- Board only \$7.60 Part No. 109, with parts \$27.50 Part No. 109A

DISKETTES

Box of 10, 5" \$29.95, 8" \$39.95. Plastic box, holds 10 diskettes, 5" - \$4.50, 8" - \$6.50.

APPLE II[®] SERIAL I/O INTERFACE

Baud rate is continuously adjustable from 0 to 30,000 • Plugs into any peripheral connector • Low current drain. RS-232 input and output • On board switch selectable 5 to 8 data bits, 1 or 2 stop bits, and parity or no parity either odd or even • Jumper selectable address • SOFTWARE • Input and Output routine from monitor or BASIC to teletype or other serial printer • Program for using an Apple II for a video or an intelligent terminal. Also can output in correspondence code to interface with some electrics. • Also watches DTR • Board only \$15.00 Part No. 2, with parts \$42.00 Part No. 2A, assembled \$62.00 Part No. 2C

8K EPROM PIGEON

Saves programs on PROM permanently (until erased via UV light) up to 8K bytes. Programs may be directly run from the program saver such as fixed routines or assemblers. • S-100 bus compatible • Room for 8K bytes of EPROM non-volatile memory (2708's). • On-board PROM programming • Address relocation of each 4K of memory to any 4K boundary within 64K • Power on jump and reset jump option for "turnkey" systems and computers without a front panel • Program saver software available • Solder mask both sides • Full silkscreen for easy assembly. Program saver software in 1 2708 EPROM \$25. Bare board \$35 including custom coil, board with parts but no EPROMS \$139, with 4 EPROMS \$179, with 8 EPROMS \$219.

WAMECO PRODUCTS WITH

ELECTRONIC SYSTEMS PARTS

FD-1 FLOPPY CONTROLLER BOARD will drive shugart, pertek, remex 5" & 8" drives up to 8 drives, on board PROM with power boot up, will operate with CPM (not included). PCBD \$42.95

FPB-1 Front Panel. (Finally) IMSAI size hex displays. Byte or instruction single step. PCBD \$42.95

MEM-1A 8Kx8 fully buffered, S-100, uses 2102 type RAMS. PCBD \$24.95, \$168 Kit

QMB-12 MOTHER BOARD. 13 slot, terminated, S-100 board only \$34.95 \$89.95 Kit

CPU-1 8080A Processor board S-100 with 8 level vector interrupt PCBD \$25.95 \$89.95 Kit

RTC-1 Realtime clock board. Two independent interrupts. Software programmable. PCBD \$25.95, \$60.95 Kit

EPM-1 1702A 4K EPROM \$25.95 \$49.95 with parts less EPROMS

EPM-2 2708/2716 16K/32K EPROM card PCBD \$24.95 \$49.95 with parts less EPROMS

QMB-9 MOTHER BOARD. Short Version of QMB-12. 9 Slots PCBD \$30.95 \$67.95 Kit

MEM-2 16Kx8 Fully Buffered 2114 Board PCBD \$25.95, \$269.95 Kit

RS-232/ TTL INTERFACE

- Converts TTL to RS-232, and converts RS-232 to TTL
- Two separate circuits
- Requires -12 and +12 volts
- All connections go to a 10 pin gold plated edge connector, kit \$ 9.95 Part No. 232A 10 Pin edge connector \$3.00 Part No. 10P.

RS-232/TTY INTERFACE

This board has two active circuits, one converts RS-232 to 20mA, and the other converts 20mA to RS-232. Requires +12 and -12 volts. \$9.95 Part No. 600A Kit.

T.V. TYPEWRITER

- Stand alone TVT
- 32 char/line, 16 lines, modifications for 64 char/line included
- Parallel ASCII (TTL) input
- Video output
- 1K on board memory
- Output for computer controlled cursor
- Auto scroll
- Non-destructive cursor
- Cursor inputs: up, down, left, right, home, EOL, EOS
- Scroll up, down
- Requires +5 volts at 1.5 amps, and -12 volts at 30 mA
- All 7400, TTL chips
- Char. gen. 2513
- Upper case only
- Board only \$39.00 Part No. 106, with parts \$145.00 Part No. 106A

TAPE INTERFACE

- Play and record Kansas City Standard tapes
- Converts a low cost tape recorder to a digital recorder
- Works up to 1200 baud
- Digital in and out are TTL-serial
- Output of board connects to mic. in of recorder
- Earphone of recorder connects to input on board
- No coils
- Requires +5 volts, low power drain
- Board only \$7.60 Part No. 111, with parts \$27.50 Part No. 111A

UART & BAUD RATE GENERATOR

- Converts serial to parallel and parallel to serial
- Low cost on board baud rate generator
- Baud rates: 110, 150, 300, 600, 1200, and 2400
- Low power drain +5 volts and -12 volts required
- TTL compatible
- All characters contain a start bit, 5 to 8 data bits, 1 or 2 stop bits, and either odd or even parity.
- All connections go to a 44 pin gold plated edge connector
- Board only \$12.00 Part No. 101, with parts \$35.00 Part No. 101A, 44 pin edge connector \$4.00 Part No. 44P

HEX ENCODED KEYBOARD

^{E.S.} This HEX keyboard has 19 keys, 16 encoded with 3 user definable. The encoded TTL outputs, 8-4-2-1 and STROBE are debounced and available in true and complement form. Four onboard LEDs indicate the HEX code generated for each key depression. The board requires a single +5 volt supply. Board only \$15.00 Part No. HEX-3, with parts \$49.95 Part No. HEX-3A. 44 pin edge connector \$4.00 Part No. 44P.

S-100 BUS ACTIVE TERMINATOR

Board only \$14.95 Part No. 900, with parts \$24.95 Part No. 900A

DC POWER SUPPLY

- Board supplies a regulated +5 volts at 3 amps., +12, -12, and -5 volts at 1 amp.
- Power required is 8 volts AC at 3 amps., and 24 volts AC C.T. at 1.5 amps.
- Board only \$12.50 Part No. 6085, with parts excluding transformers \$42.50 Part No. 6085A

To Order: Mention part no. description, and price. In USA shipping paid by us for orders accompanied by check or money order. We accept C.O.D. orders in the U.S. only, or a VISA or Master Charge no., expiration date, signature, phone no., shipping charges will be added. CA residents add 6.5% for tax. Outside USA add 10% for air mail postage and handling. Payment must be in U.S. dollars. Dealer inquiries invited. 24 hour order line (408) 448-0800

New Trackball Products Catalog

Trackball Products

MS
Measurement Systems, Incorporated
121 Water St. Norwalk, CT 06854
Tel: (203) 841-2100 • Cable: MS121100 • Telex: 15-114

Measurement Systems Inc has announced publication of their 12-page catalog of Trackball products. Trackballs are widely used for the human operator to perform positioning or contouring tasks on interactive displays either in computer peripherals or radar systems. Almost one half of the catalog contains technical and application data so that the reader gains a full understanding of this product. The balance of the catalog provides extensive data on specific standard items with options available. Fourteen trackballs are described, ranging in size from 2 to 3½ inches in diameter (5.08 to 8.89 cm). For further information, contact Measurement Systems Inc, 121 Water St, Norwalk CT 06854.

Free Apple Software Catalog from Rainbow

This 45-page catalog includes over 100 games of all types, fifteen business applications, twelve demonstration programs from voice recognition and speech synthesis to high-resolution and color graphics, and software

development programs. Rainbow's "Pot O' Gold" of 49 games and demonstrations is also featured.

Prices for programs on cassette and diskette average around \$10 to \$20. Write Rainbow Computing Inc at 9719 Reseda Blvd, Northridge CA 91324 or call (213) 349-5560 for your free catalog.

PIPS for VIPS

PIPS written by Tom Swan contains 160 pages of programs and documentation for use on the RCA COSMAC VIP, and an appendix describing modifications which can be made to allow the *PIPS* programs to be run on the ELF computers.

The first program, "Character Designer," facilitates building and editing a complete American Standard Code for Information Interchange (ASCII) and graphics character set, the remaining three programs use the display capabilities generated by the "Character Designer" to build text files. "Messenger" allows easy text and graphics display from within CHIP-8; "Text Editor-21" is a general-purpose text editor, and "Disassembler-7" is an 1802 machine language disassembler. All these programs utilize a high-resolution display method described in *PIPS*. The remaining programs in the book are a "CHIP-8 Program Editor" and two games written in CHIP-8: Space Wars and Surround.

The book is available from Aresco, POB 1142, Columbia MD 21044, for \$19.95. The price includes a companion cassette containing all the *PIPS* programs.

New Book Series on Computers

Academic Press Inc, 111 5th Ave, New York NY 10003, is publishing a series of books that cover a wide range of topics in the computer field.

Physics of Computer Memory Devices, Artificial Intelligence, Computer Vision Systems, Pattern Recognition and Artificial Intelligence, and Associative Networks are some of the books now on the market.

The prices range from \$29 to \$39.50

Circle 543 on inquiry card.

Book on Microprocessors from Texas Instruments

Written in nontechnical language, *Understanding Microprocessors* covers the aspects of microcomputer systems which use a microprocessor chip as the central unit for processing and control. This book provides the layman with the basics of what comprises a microprocessor, how it fits into the microcomputer system, what other system parts are necessary and how the microcomputer system functions. It introduces the reader to digital electronics, integrated circuit functions and includes 8- and 16-bit microprocessor applications with exercises and solutions. It is priced at \$4.95 and is available from Texas Instruments Inc, POB 3640, MS 84, Dallas TX 75285.

Circle 544 on inquiry card.

Free TIB0203 Data Book from Texas Instruments

A data book on the TIB0203 magnetic bubble memory has been announced by Texas Instruments Inc, POB 225012, Dallas TX 75265. The 48 page book, publication number LCC4430, contains complete specifications on the TIB0203 and, in addition, an 8 page discussion on the basic fundamentals and advantages of magnetic bubble memories. Also included in the manual are specification sheets for the interfacing integrated circuits which have been designed for use with the TIB0203. The additional data sheets include those for SN74LS361 function timing generator, SN75281 sense amplifier, SN75380 function driver, and SN75382 coil driver. Data sheets for standard devices which are needed for bubble memory system design, such as TSP102 thermistor and VSB53 Schottky-diode bridge, are also included.

**SSM PB1
2708/16
EPROM BOARD**
• S-100 Bus
Programs eproms. Has provisions for 4K or 8K of eprom. With test-socket sockets.
Cat No. 1440 PB1 kit \$135

**SSM CB2
Z-80(A)
CPU BOARD**
2 or 4 MHz, dip switch selectable. 2 sockets for 2716's or 2732 eproms or TMS4016 rams. MWRITE, firmware vector jump. Allows more than 64K ram.
Cat No. 2046 kit \$199

**SSM SB1
MUSIC
SYNTHESIZER**
• S-100 Bus
Freq range 15-20,000 Hz. Software uses only 4K RAM. Uses standard ASCII encoding for music encoding. Includes limiter. Use more than one board for chords and harmonies.
Cat No. 1408 SB1 kit \$145 (with software)
Cat No. 1410 SB1 bbd \$35

**CCS 7115A
APPLE II
PROM MODULE**
Add firmware without changing ROMs. 14K space available. Uses 5V 2716 eproms.
Cat No. 1630 kit \$62
Cat No. 1631 a&t \$72

**CCS MXVI
16K STATIC
RAM MODULE**
• S-100 Bus
Fully buffered, addressable in 4K blocks. Plugs right in most S-100 computers. 2 versions of bank select: bank byte or bank port.
Cat No. 1601A 450ns kit \$285
1601B 200ns kit \$330
1602A 450ns a&t \$330
1602B 200ns a&t \$375
1603 bbd only \$27

**SSM AIO
SERIAL/
PARALLEL
INTERFACE**
• Apple Bus
One RS-232 serial, two bi-directional parallel. Interface your Apple to printers, plotters, terminals. With firmware, cables.
Cat No. 1918 AIO kit \$129
Cat No. 1919 AIO a&t \$169

**SSM VB3
80 CHAR.
VIDEO BOARD**
• S-100 bus
80 char/line, 24 lines. upper & lower case, plus 256 user defined symbols, plus 160 x 204 graphics. Memory mapped. US and European compatible.
Cat No. 2047 2MHz kit \$369
Cat No. 2049 4MHz kit \$395

**SD SYSTEMS
VERSAFLOPPY**
• S-100 Bus
Operates with Z-80, 8080(A), 8085. Controls up to four 5 1/4" or 8" drives. Dozens of features.
Cat No. 1516 kit \$159

**CCS 7710A
APPLE II
ASYNCHRONOUS
SERIAL
INTERFACE**
Interfaces printers, etc. Features serial with full handshaking, and RS-232C (A thru E).
Cat No. 1623 kit \$90
Cat No. 1624 a&t \$145

**CCS APPLE
& S-100
PROTOTYPING
BOARDS**
Signals labeled on-board.
Cat No. Description Price
1606 Apple Wirewrap \$21
1607 Apple soldertail \$21
1608 Apple etch \$18
1604 S-100 soldertail \$26
1605 S-100 wirewrap \$26
1609 S-100 etch \$23

**SSM VB1B
VIDEO
INTERFACE**
• S-100 Bus
64 x 16 video, upper and lower case, greek. Composite and parallel video. White on black, or reverse.
Cat No. 1417 VB1B kit \$129
Cat No. 1419 VB1B bbd \$ 26

**ITHACA
Z-80 CPU
BOARD** • S-100 Bus
2.5MHz or 4 MHz, on board 2708, optional MWRITE, allows operation without front panel.
Cat No. 1512 bareboard \$32

**SD SYSTEMS
EXPANDORAM**
• S-100 Bus
Interfaces with Sol, Altair, Imsai, Cromemco, etc. Expand dynamic memory in blocks of 8 to 64K. Dip switch selection for positioning boundaries. Write protect, phantom output disable. Uses 4116 rams.
Cat No. 1517-0 kit \$185
Cat No. 1156-C 16K RAM \$80ea

**CCS 7712A
APPLE II
SYNCHRONOUS
SERIAL
INTERFACE**
RS-232C (A thru E). Standard synchronous signalling rate per RS269/ANSI x3.1-1976.
Cat No. 1627 kit \$90
Cat No. 1628 a&t \$145

**CCS 7811A
APPLE II
ARITHMETIC
PROCESSOR**
Add high powered math to your Apple! Increases math power by 10x! For number crunching, graphics.
Cat No. 1635 a&t \$390

**SSM IO4
2 SERIAL +
2 PARALLEL
PORTS** • S-100 Bus
Full handshaking, 20/60mA current loop. Dip switch address selection.
Cat No. 1411 IO4 kit \$139
Cat No. 1413 IO4 kit \$ 26

**ITHACA
2708/16
EPROM BOARD**
Accepts up to 16 eproms. Dip switch addressable to any 1K location. Unused ROM locations may be allocated to RAM by dip switch.
Cat No. 1511 bareboard \$28

**SD SYSTEMS
VIDEO DISPLAY
BOARD** • S-100 Bus
Interfaces a monitor and a keyboard to the S-100 Bus. On-board Z-80 controls functions. 80 x 24 display. 2K on-board RAM.
Cat No. 1599 kit \$318

**CCS 7520AK
APPLE II
EXTENDER
BOARD**
Use for debugging or testing modules in the Apple II.
Cat No. 1611 kit \$21

**CCS GPIB
IEEE 488 BUS
INTERFACE**
Interface test equipment (equipped with 488 bus) to the Apple! Also interfaces the PET to the Apple.
Cat No. 2051 a&t \$295

**SSM CB1A
8080A
CPU BOARD**
• S-100 Bus
2K of PROM, 1K of RAM. Power on/reset, vector jump, parallel port with status.
Cat No. 2044 kit \$155
Cat No. 2045 bbd \$26

**TARBELL
CASSETTE
INTERFACE**
• S-100 Bus
Fastest transfer rate: 187 to 540 bytes/sec. Phase encoding (self-clocking). Generates Kansas City tapes.
Cat No. 1756 kit \$120

**WAMECO
QMB-12
12 SLOT
MOTHERBOARD**
• S-100 Bus
Very quiet! On-board kluge area accepts up to two 40-pin sockets. Also area for 3 separate voltages.
Cat No. 1507 bareboard \$36

**CCS 7720A
APPLE II
PARALLEL
INTERFACE**
Interface printers and other peripherals. Programmable interrupt, 2 bi-directional ports, full handshaking.
Cat No. 1632 kit \$62
Cat No. 1633 a&t \$105

**Send for
FREE CATALOG**
The best selection of computer accessories add-ons, factory fresh IC's, led's, semi's, software, PC aids, prototyping aids, books, test equipment, and more! Always up-to-date! Dozens of new products every issue!

**MARINCHIP
M9900
16 BIT CPU**
• S-100 Bus
Includes DOS, BASIC, word processor, text editor, assembler, linker, diagnostics and debug tools. Increases system performance by a factor of 2!

**TARBELL
32K STATIC
RAM** • S-100 Bus
Extended addressing (bank switching), phantom line, low power requirements. 9 on-board regulators!
Cat No. 1979 kit \$625

**WAMECO FDC-1
FLOPPY DISK
CONTROLLER**
Controls up to eight Shugarts, Perfec's, Remes's, or MPI's. Also designed to operate with CPM software. Compatible with Z-80 or 8080 systems.
Cat No. 1377 bareboard \$48

**CCS 7470A
APPLE II
BCD A/D
CONVERTER**
Single channel A/D. 12 bits. Allows conversion of -4 to +4 VDC to a BCD number, 2000uV/conversion.
Cat No. 1621 kit \$115
Cat No. 1622 a&t \$135

HOW TO ORDER
Pay by check, COD, VISA, or Mastercharge. Charge orders include expiration date. Order by phone or mail. Minimum order \$10. Please include phone number and magazine/issue you are ordering from. USA: Add \$2 for shipping/handling ground, add \$3 for air. FOREIGN: Add \$3 for shipping/handling surface, \$6 for air. COD's \$1 add'l. Guaranteed satisfaction for 120 days or your money back! Not responsible for typographical errors. We reserve the right to limit quantities.

Cat No.	Description	Price
1379	M9900 CPU kit	\$550
1950	as above, a&t	\$700
1951	PROM/RAM/SIO kit	\$275
1964	as above, a&t	\$350
1940	PASCAL	\$150
1941	META	\$ 50
1942	System generation kit	\$100
1943	Full documentation	\$ 20

**TARBELL
FLOPPY DISK
INTERFACE**
• S-100 Bus
Up to 4 single drives in daisy chain. 250 bits per sec. Works with modified CPM and BASIC compiler. Build in phantom bootstrap.
Cat No. 1901 kit \$190
Cat No. 1774 bareboard \$ 40

**WAMECO FPB-1
FRONT PANEL
BOARD**
Similar to Imsai. Controls 8080A computer. Features memory examine, memory deposit, RUN, STOP, RESET. Hex displays. Byte or instruction single step.
Cat No. 1322 bareboard \$47

**CCS 2520A
EXTENDER/
TERMINATOR
BOARD** • S-100 Bus
Active and/or dynamic termination. Labeled S-100 signals.
Cat No. 1610 kit \$38

What's New?

PUBLICATIONS

New COS/MOS Integrated Circuit Manual Issued by RCA

A new 168-page edition of the RCA COS/MOS Integrated Circuits Manual, CMS-272, is available for \$5 from RCA Solid State Division, Rt 202, Somerville NJ 08876. This manual provides detailed

information on the design, operation, and application of COS/MOS digital integrated circuits ranging from simple gates to highly complex large-scale integrated devices.

The manual begins with the basic principles of complementary symmetry MOS integrated circuits, and then describes the circuit elements from which the more complex COS/MOS integrated circuits are developed. It gives the features and characteristics of current RCA A-series and B-series types as well as device handling and operating considerations. Design examples and performance data are given for COS/MOS devices in a wide variety of circuit applications, such as, astable and monostable multivibrators, crystal oscillators for digital timekeeping, shift registers and counters, display drivers, and digital frequency synthesizers.

New material includes an introduction to microprocessors and memory interfacing, as well as guidelines to the design of custom large-scale integrated circuits. The information in this manual is presented in thirteen well-illustrated, easy-to-read text sections.

Circle 545 on inquiry card.

Management Guide to 100 Word Processors

This new report tells a manager which word processors are commonly used in different industries, which models are used in specific applications, who services the system after it is purchased, and which word processors are feasibly priced. In addition to charting this information for 100 models, the guide provides a directory of suppliers, which includes name, address, and phone number.

Word Processing Market Report is available for \$15 from Alltech Publishing Co, 212 Cooper Ctr, N Park Dr and Browning Rd, Pennsauken NJ 08109.

The First New England Microcomputer Resource Handbook

This guide to microcomputers for novices, prospective purchasers and system owners contains sections on product comparisons, application software, buying tips, support devices, computer stores, introductory information, publications, user groups, consultants, books, repair companies and a glossary which defines buzz words in terms of real-life situations. The, 115-page book is available for \$2 from New England computer stores or from The Boston Computer Society, 17 Chestnut St, Boston MA 02108.

Circle 550 on inquiry card.

Belais' Master Index to Computer Programs in BASIC

Source information and detailed reviews of 531 documented, ready-to-run programs in 72 fields covering home and business are included in this book. Updates and reprints also are listed. The book utilizes technical and layman's languages to describe the programs.

This 192-page paperback is available for \$9.95 plus \$1 shipping from Falcon Publishing, Dept G, 140 Riverside Ave, POB 688, Ben Lomond CA 95005.

Circle 546 on inquiry card.

PET Quick Reference Card

This card contains a complete summary of the Commodore PET BASIC language along with examples and definitions of every command and a table of the PET's graphic characters with their hexadecimal equivalents. Programmers will find a table of memory locations as well as information on the user port, PET sound, and the IEEE-488 interface bus.

The price is \$3.50. For more information, contact Leading Edge Computer Products, POB 3872, Torrance CA 90510.

A low cost Modem for your APPLE that lets you be a part of it all.

Complete with software on cassette **\$284⁹⁵**

Keep up with the latest information, share your ideas and programs with other hobbyists, time-share clubs, colleges, businesses, friends . . . anywhere, everywhere across the country.

The MICRONET MODEM, an originate-answer and auto-answer modem, part of the Automodem II series, is furnished with an FCC registered coupler and two inter-connecting cables and plugs into any standard telephone jack.

MICRONET . . . enhanced by a handsomely styled and coordinated enclosure with a simple inexpensive interface to the APPLES' game jack, allows you to make full use of all the input/output slots provided for other peripherals. Full compatibility with Bell, Westinghouse 103, and Westinghouse 113.

Don't be left behind . . .

Order the MICRONET MODEM today!

Manufactured by Micromate Electronics, Inc.

ASCII KEYBOARD * KIT \$79.95

ASCII KEYBOARD KIT — Assembled and Tested \$95.95

• Single +5V Supply • Full ASCII Set (Upper and Lower Case) • Parallel Output • Positive and Negative Strobe • 2-Key Rollover • 3 User Definable Keys • P.C. Board Size: 17-3/16" x 5" • Control Characters Molded on Key Caps • Optional Provision for Serial Output. OPTIONAL: Metal Enclosure \$27.50 • Edge Con. \$2.00 • Sockets \$4.00 • Upper Case Lock Switch \$2.50 • Shift Register (for Serial Output) \$2.00. Dealer inquiries invited.

APPLE II I/O BOARD * KIT \$49.00

APPLE II I/O BOARD KIT — Plugs into Slot of Mother Board

• 1 8-Bit Parallel Output Port (expands to 3 Ports) • 1 Input Port • 15mA Output Current Sink or Source • Can be used for peripheral equipment such as printers, floppy discs, cassettes, paper tapes, etc. • 1 Free Software Listing for SWTP PR40 or IBM selectric. PRICE: 1 Input and 1 Output Port \$49.00, 1 Input and 3 Output Ports \$60.00. Dealer inquiries invited.

VENUS 2001 VIDEO BOARD kit \$199⁹⁵

Assembled and Tested \$259.95 • Complete Unit with 4K Memory and Video Driver on Eprom assembled and tested \$339.95. OPTIONAL: • Sockets \$10.00 • 2K Memory \$30.00 • 4K Memory \$50.00 • Video Driver Eprom \$20.00.

S-100 Plug-In • Parallel Keyboard Port — On board 4K Screen Memory (optional). On board Eprom (optional) for Video Driver or Text Editor Software. **Up and down scrolling through video memory** — Reverse Video, Blinking Characters. **Display:** 128 ASC 11 Characters 64x32 or 32x16 Screen Format (Jumper Selectable), 7 by 11 Dot Matrix Characters.

American or European TV Compatible (CRT Controls Programmable). Dealer inquiries invited.

THE APPLESTICK™ \$49⁹⁵

Just plug it into your game connector and make your present games more enjoyable.

The APPLESTICK is a wonderful add-on for your Apple II. With an APPLESTICK you can enjoy the smooth, easy control of a true 360° joystick.

Manufactured by Micromate.

Not recommended for scientific applications requiring linearity.

FREE Paper Tiger

With Purchase of The INTEGRAL DATA 440

Your Choice, \$200 Value

- 1) Graphics Option Package
- 2) Interface for APPLE II
- 3) TRS-80 Printer Interface

California Digital has recently researched the complete low cost printer market. It is our opinion that the IDS 440 Paper Tiger is, without doubt, the most versatile and offers the best value of any printer costing under \$1,000.

This quality dot matrix printer incorporates such features as software selectable character size to allow print densities upto 132 characters per line. Full forms handling capabilities and tractor feed mechanism adjustable to 9.5". The Paper Tiger is engineered to accept either parallel or RS232 serial ASCII. 110/220V.50/60Hz.

SYSTEM X-10

It's not often that California Digital ventures into the distribution of consumer products, but we have recently come across a product that appears so unique that we just had to add it to our product line. This is the System X-10 manufactured by the 88bit turntable company. This space age system will remotely control any light or appliance in your home or office. Command signals are transmitted from the command console over your existing wiring. From your bed or easy chair you can control up to 16 different electrical devices inside and outside your home. Use the System X-10 to control your stereo, television or any light fixture on the premises.
The modular system is available in the following components:
Ultrasonic Master Control Console..... \$34.95
Battery Operated Ultrasonic Controller..... 19.85
Appliance Module, Lamp Module or Wall Switch..... 13.85

MEMORY

TRS-80 \$65
APPLE II 65
16k memory (8) 4116's

Installation is simple. Anyone who has ever changed a spark plug should be able to up-grade his microcomputer. How can California Digital offer these memory up-grade sets at 25% below our competition? Simple, we buy in volume, wholesale to dealers and sell the balance directly to owners of personal microsystems. These 16K dynamic memory circuits are factory prime and unconditionally guaranteed for one full year. NOW, before you change your mind, pick up the telephone and order your up-grade memory from California Digital. Add \$3 for TRS80 jumpers.

Regent 25 from APPLIED DIGITAL DATA SYSTEMS

Buying a CRT Terminal?
Hazeltine • Soroc • Lear Siegler
Well if you really insist upon purchasing one of the above terminals, sure, we'll sell it to you. But when the keyboard starts to double bounce, the screen fades and the power supply just craps out don't call us, complain to the manufacturer.
The alternative, take a serious look at the ADDS Regent 25, we have, and concluded that this terminal offers, the best value in today's market. Through years of research the ADDS Company has evolved a low maintenance, extremely durable CRT terminal capable of withstanding an abusive 24 hour duty cycle. The Regent 25 features Intel 8085 microprocessor controlled circuitry along with the Cherry Switch long-life capacitance keyboard.
18 key cursor and numeric pad doubles to allow for user definable special functions. True descending lower case characters along with a fully addressable cursor makes the Regent 25 the ideal word processing terminal. High-resolution screen is capable of displaying 96 upper and lower case ASCII characters and 32 control codes. This unique feature assist in the debugging of programs. The Regent 25 is switch selectable to display six European languages along with Katakana.
Clearly the Regent 25 is not your average terminal, but than, ADDS is not your average terminal company.

PORTABLE DATA ENTRY SYSTEM
\$1395.00
These used data terminals were originally designed for chain store inventory control and order entry systems. The operator enters the inventory control number, merchandise on hand and the unit price. After all pertinent data has been entered into the recorder, the main warehouse is telephoned, the handset is placed in the acoustic coupler and all the recorded information is transmitted back to the master computer. With a little imagination and one of these portable entry systems, you should be able to exchange programs and computer information with associates across the country. All units were removed from service in working condition. Original cost \$2,500. Each system comes complete with:
*Portable Cassette Drive Unit *Fiber Glass "D" StCads *DB25 Cable
*Non-volatile Entry Keyboard *Acoustical Coupler *Shooter's strap
*Battery Charger *Full Documentation

CP/M 2.0

Digital Research has done it again! This new release of their industry standard disk operating system is bound to be an even bigger hit than the original version. All of the fundamental file-size restrictions of release 1 have been eliminated, while maintaining full compatibility with the earlier versions. This new release can be field-configured by the user for a single mini-disk up through a multiple drive hard-disk system with 128 megabyte capacity. Field configuration can be accomplished easily through use of the Macro Library (DISKDEF) provided with CP/M 2.0.

WHY THE 2114 RAM CHIP?

We feel the 2114 will be the next industry standard RAM chip (like the 2102 was). This means price, availability, and quality will all be good! Next, the 2114 is FULLY STATIC! We feel this is the ONLY way to go on the S-100 Bus! We've all heard the HORROR stories about some Dynamic Ram Boards having trouble with DMA and FLOPPY DISC DRIVES. Who needs these kinds of problems? And finally, even among other 4K Static RAM's the 2114 stands out! Not all 4K static Rams are created equal! Some of the other 4K's have clocked chip enable lines and various timing windows just as critical as Dynamic RAM's. Some of our competitor's 16K boards use these "tricky" devices. But not us! The 2114 is the ONLY logical choice for a trouble-free, straightforward design.

KIT FEATURES:

1. Addressable as four separate 4K Blocks.
2. ON BOARD BANK SELECT circuitry (Cromemco Standard). Allows up to 512K on line!
3. Uses 2114 (450NS) 4K Static Rams.
4. ON BOARD SELECTABLE WAIT STATES.
5. Double sided PC Board, with solder mask and silk screened layout. Gold plated contact fingers.
6. All address and data lines fully buffered.
7. Kit includes ALL parts and sockets.
8. PHANTOM is jumpered to PIN 67.
9. LOW POWER: under 2 amps TYPICAL from the +6 Volt Bus.
10. Blank PC Board can be populated as any multiple of 4K.

ZENITH

NEW

COLOR VIDEO MONITOR

The answer to the TV problem

Zenith's first color video display designed specially for computers. Your Apple won't have to force a signal through an RF-modulator and a TV tuner before it goes up on the screen. Zenith gives you the direct video connection through a standard RCA-type phono jack. A separate tip-type input jack is provided for high-impedance input to the audio system. This 13-inch monitor uses a vertical black stripe guardband with in-line tri-potential electron gun and includes automatic, color level, color processing and degaussing circuits. The 100% solid-state circuitry also takes care of the vertical and horizontal hold adjustments. Black high-impact styrene case with chrome trim.

CP/M* Source Code -- FREE! when you purchase "OS-1"
 Electrolabs' new operating system for the Z-80 designed to have exactly
 the appearance of UNIX**, including virtual I/O, "set TTY", a tree and a
 shell, filters and pipes PLUS total compatability with CP/M software!

OS-1[®] FEATURES

(Because OS-1 is truly a comprehensive "OS", and not merely a file handling "DOS", we have changed the name from "Superdos" to "OS-1")

- VIRTUAL I/O - copy with a single command between floppy and hard disk, or from TTY to printer to tape to disk... etc., etc.
 No messy I/O routines to write, & no awkward transfers.
- SECURITY - 9 modes of file protection, user and login protection.
- MULTI-USER - up to 256 passwords. (non-simultaneous users)
- 16MBy FILE SIZE - but no limit to no. of directories per device, thus allowing EASY implementation of gigantic storage devices.
- "SET TTY" - for printer or crt: tabs, page width, buffer, cursor, UC/LC, fonts, formfeed, arbitrary control characters etc., etc.
- "LOGIN" - automatically executes user selected programs and "set TTY"
- OCCUPIES 12KBy - only 50% larger than CP/M, but 500% more features.
- CP/M & CDOS COMPATABLE - your library is guaranteed to run!

* (Naturally, we are not giving away the version of CP/M written by Digital Research, Please pardon our pun, but they might object. What we ARE giving you is a greatly enhanced version of CP/M which resides on OS-1, and allows the user of OS-1 to run any and all of his programs, packages or system utilities which are already running on CP/M. We give you the source code at no charge so that you may modify any part of the CP/M to suit your own system requirements. At no charge, you also receive the enhancement allowing 4MBy files instead of 256K.)

OS-1 (with debugger, linker and screen oriented editor)	\$199.00
Update service, per year	29.00
Symbolic Debugger	150.00
MACRO-Assembler (Creates relocatable code)	150.00
"C" Compiler	660.00
FORTRAN Compiler	100.00
BASIC Compiler (very fast)	150.00

Graphics

High Resolution 480 x 512
 for B&W and Color Imaging and Graphics

Light pen, A-D, D-A, TV synchro (needs no time base correction or adjustment with anything between random interface & NTSC commercial standard), T.V. single frame grabber ("snapshot"). Up to 1 Byte of attributions per pixel.

LSI-100 & S-100 applied to:

Graphic Presentation — such as computer generated animation & other graphic displays up to 256 colors & up to 256 b&w gray scales. **Image Analysis** — using built-in FRAME GRABBER, for medical image enhancement, contour analysis, & pattern recognition. **Commercial TV Tilting & Advertising** — using synchronization capability. **Interactive graphics** — using light pen accessory.

BASIC CONFIGURATION —

LSI-11 \$1995, S-100 \$1265.
 For TRS-80/Exidy Add \$595.00
 Includes: Data Board - 32K (480 x 512 x 1 pixel) D-A 16 level video generator, Video Synchronization Circuitry, Address Control & Timing Board.

FEATURES — High speed, DMA or 2KBy window memory mapped interface. Full NTSC commercial color capability. Low power consumption. Excellent Software

Options — Accessories — Software

Options include: light pen, auxiliary outputs, text mode, memory and much more. Accessories include: b&w and color cameras and monitors. Software: "Plot" 2D or 3D, "Tilting", "Contour", "Image Enhancement", "Vector Curve Generation".

TEACHERS! THE ELECTRONIC ROLLBOOK ©

is a plush, disk-based program that maintains your class rolls in a disk file; allows you to enter grades, add, delete or edit, compute class averages, alphabetize, line-print, assign grades, display a histogram, and much more.

You can enter new grades without having to alphabetize your papers or enter the student's names or look up anything in a directory!

For TRS-80* with one disk and 32K: \$39.95.

tinyFORTH

tinyFORTH is a powerful interactive programming system for the TRS-80. **tinyFORTH** combines the structured high-level language, text editor, and assembler of FORTH with the graphics and cassette I/O of the TRS-80.

tinyFORTH programs are quickly developed by defining new modules in terms of previously defined modules. Each new module is compiled for fast execution and compact memory space.

tinyFORTH is easy to learn. The user's manual contains hundreds of examples to teach you **tinyFORTH** in a hands-on style. Special chapters explain graphics, applications, the text editor, and the assembler.

tinyFORTH cassette for 16k level II TRS-80 and full documentation.....\$29.95
 Documentation only.....\$9.95

All orders are fully guaranteed. Add \$1.50 for postage and handling. Order with check, money order, Visa, or MasterCard.

Widen the ability of your TRS-80

The Vista V80: \$395

The Vista V80 Mini Disk System is the perfect way to widen the capabilities of your TRS-80* Micro-computer. Quickly and inexpensively. Our \$395 price tag is about \$100 less than the Radio Shack equivalent. Our delivery time is immediate (24 hour turn-around from our Santa Ana, Ca. factory). And our system is fully interchangeable. That's just the start.

It will give you 23% more storage capacity by increasing useable storage from 55,000 to 65,000 bytes per drive with our new software patch.

It can work 8 times faster than the TRS-80 Mini-Disk system, because track-to-track access is 5ms versus 40ms for the TRS-80. You can realize this added speed

once the new double disk expansion interface is available without expensive modification of the existing unit.

It has a better warranty than any comparable unit warranty available – a full 120 days on all parts and service. When you consider how much more goes into the Vista V80, that shows a lot of faith in our product.

A full 3 amp power supply means you have 2½ times the power necessary to operate the V80, and full ventilation insures that there will be no problems due to overheating.

The Vista V80 Mini Disk System requires Level II Basic with 16K RAM Expansion interface (it operates from the Radio Shack interface system. It

comes complete with a dependable MPI Minifloppy disk drive, power supply, regulator board and vented case. It's shipped to you ready to run – simply take it out of the box and plug it in. You're in business. From the company that means business – Vista Computer Company.

The Vista Computer Company.
Manufacturers of Quality
Computer Systems
and Software.

The EXPANDORAM is available in versions from 16K up to 64K, so for a minimum investment you can have a memory system that will grow with your needs. This is a dynamic memory with the invisible on-board refresh, and IT WORKS!

- Bank Selectable
- Phantom
- Power 8VDC, +16VDC, 5 Watts
- Lowest Cost Per Bit
- Uses Major Brand 16K RAMS
- PC Board is doubled solder masked and has silk-screened parts layout
- Extensive documentation clearly written

SD EXPANDORAM

- Complete kit includes all Sockets for 64K
- Memory access time: 375ns, Cycle time: 500ns.
- No wait states required
- 16K boundaries and Protection, via Dip Switches
- Designed to work with Z-80, 8080, 8085 CPU's

SD'S PROM 100 PROM Programmer Board
The PROM-100 Programmer is a development tool for S-100 Bus computer systems. The Zero Insertion Force Programming Socket extends above the card cage height for easy access to PROM devices. Software verifies PROM erasure, verifies program loading and provides for reading of object file from Disk or PROM and programming into PROM/EPROM. Features include: On-board generated 25vdc Programming pulse, TTL compatible, maximum programming time for 16,389 bits is 100 seconds. Programs: 2708, Intel 2758, 2716, 2732 and TI 2516. DIP Selectable EPROM type.

PROM-100 Board Kit \$149.95

SD'S MPB-100 Z80 CPU BOARD KIT
The MPB-100 provides, a Z80 microprocessor based CPU for S-100 Bus systems. Front panel usage is optional, making the MPB-100 suitable for upgrading existing systems to Z80 level. A PROM socket is provided on-board which makes the MPB-100 adaptable to process control applications. Features include: Power-on Jump to 4K boundaries, 2 Megahertz or 4 Megahertz operation, optional wait states, on-board PROM socket.

MPB-100 KIT \$199.00

SD'S VERSAFLOPPY II
IBM 3740 Compatible Soft Sector Format for Single Density Drives • Operates with Single and Dual Sided Drives, Single or Double Density Drives and 5" & 8" Drives — in any combination of four simultaneously • Drive Select and Side Select Circuitry • S 100 Bus Compatible • Vectored Interrupt Operation Optional • Phase Locked Loop Data Recovery Circuit • Operates with Z80 CPU's • Uses FD1791-1 Controller Chip • The Versafloppy II incorporates all the possible features of a flexible disk drive controller into one board. Capable of handling four drives simultaneously, combinations of any variety are possible, such as 5" single sided, 8" dual density dual sided, 5" dual density single sided. Most popular drives are controlled directly with the Versafloppy II. The operating system for the Versafloppy II is the extremely powerful SDOS available for SD Systems. Diagnostic and control software available to complete your disk system.
\$290 KIT, \$385.00 ASSEMBLED & TESTED

SD'S VDB-8024 VIDEO DISPLAY BOARD

The VDB-8024 features its own on-board Z80 microprocessor. This gives the capability of using software (included in ROM) to control functions and enhancements without interference with the computer's CPU. Included in the special features: 80 characters by 24 lines display, keyboard power and interface, composite and separate video output, 2K on-board RAM, a total of 256 available characters, full cursor control, forward and reverse scrolling, underlining, field reverse, field protect enhancements, programmable characters.
VDB-8024 KIT \$289.00

SD'S "VERSAFLOPPY I" KIT

FEATURES: IBM 3740 soft sector compatible, S-100 BNS Compatible for Z-80 or 8080. Controls up to 4 drives (single or double sided). Directly controls the following drives: Sugart SA400/450 Mini Floppy • Shugart SA800/850 Standard Floppy • PERSCI 70 and 277 • MFE 700/750 • CDC 9404/9406
\$135.00

SD'S SBC-100 SINGLE BOARD COMPUTER

The SBC-100 provides a complete micro-computer on a single board! The Z80 microprocessor is used as the heart of the SBC-100. The SBC-100 meets all the requirements of a Z80 CPU board with the added features of I/O ports, counter/timer channels, on board RAM, provisions for PROM/ROM and a software programmable baud rate generator. S-100 Bus compatible, the SBC-100 features are: 8K bytes of available PROM, 1024 bytes on-board RAM, Serial I/O with both synchronous and asynchronous operation, Parallel I/O ports, Operational Vectored Interrupts, and Four Counter/Timer Channels. SD Monitor available for RS-232 and Video Terminals. Disk based system software also available.
SBC-100 KIT \$209.00

TARBELL FLOPPY DISK INTERFACE
Compatible with Z80 & 8080. S-100 Bus. Uses CPM operating system. Plugs directly into your IMSAI or ALTAIR • Fastest transfer rate
KIT \$190.00 Assembled & Tested \$260.00

TARBELL CASSETTE INTERFACE
Plugs directly into your IMSAI or ALTAIR • Fastest transfer rate • Extremely reliable • Phase encoded • 4 extra status & control lines
KIT \$99.95

PRINTED CIRCUIT BOARD

4" x 6" DOUBLE SIDED EPOXY BOARD 1/16" thick \$5.60 ea. 5/\$2.60

EPOXY glass vector board 1/16" thick with 1/10" spacing. \$1.95

VERIPAX PC BOARD. \$12.95
Our new Prototyping board is a hi density 4 1/2 x 6 1/2" single sided 1/16" G-10 board. It will hold 40, 24, 16 (34 units), 14 & 8 pin IC's. There are three buses, +5V, ground and a floating bus. There is a pad for a 20-220 regulator. There is a 22 pin edge connector with 156" spacing.

Three great new products for

TRS-80* Owners

MS-80 MINI DISK SYSTEM

Each add-on drive includes one minifloppy disk drive, case, power supply and regulator board.

- More Storage Capacity
- Fastest Access
- Does Not Void TRS-80 Warranty
- Shipped To You Ready To Run

2-DRIVE INTERFACE CABLE

\$24.50

4-DRIVE INTERFACE CABLE

\$34.50

INTRODUCTORY PRICE: \$395 PER DRIVE

SUGGESTED RETAIL PRICE \$445

MATCHLESS FEATURED PRINTERS

Features:

- Documentation Included
- 80 Columns, 63 Lines Per Minute, Bi-Directional, Nominal Thruput
- High Reliability — Heavy Duty Cycle, 100 Million Characters Print Head Life
- Sprocket Feed
- 5 x 7 Dot Matrix Character Font

CABLE—\$34.50

INTRODUCTORY PRICE: \$749

SUGGESTED RETAIL PRICE \$777

APPARAT NEW DOS+ \$99

Features:

- Modified Editor Assembler with Disk I/O and new cross reference feature. User Information is obtained from Radio Shack's Editor Assembler documentation.
- Super-fast machine language Disassembler program, with cross reference feature.
- Apparat's own Superzap, a Hex dump utility to examine or modify disk or memory locations.
- Transfer machine language tapes directly to disk.
- Enhancements including built-in key-debounce (eliminating double entry); option under DOS or BASIC to print the screen to your MATCHLESS featured line printer; execution of a BASIC program.

MATCHLESS
SYSTEMS

NOBODY CAN BEAT OUR MS-80 WARRANTY: 90 days on labor, One Year on parts.

Take the mystery out of programming

with the latest from *BYTE Books*[™]

You Just Bought a Personal What?

by *Thomas Dwyer and Margot Critchfield*
Whether you are a novice programmer or an experienced computer user, this book is filled with practical ideas for using a personal computer at home or work. It will take you through the steps necessary to write your own computer programs, and then show you how to use structured design techniques to tackle a variety of larger projects. The book contains over 60 ready-to-use programs written in Radio Shack TRS-80 Level II BASIC in the areas of educational games, financial record keeping, business transactions, disk-based data file and word processing. \$11.95 pp. 184
ISBN 0-07-018492-5

Beginners Manual for the UCSD Pascal System

by *Kenneth Bowles*
Written by the originator of the UCSD Pascal System, this highly informative book is designed as an orientation guide for learning to use the UCSD Pascal System. Once familiar with the system, you will find the guide an invaluable reference tool for creating advanced applications. This book features tutorial examples of programming tasks in the form of self-study quiz programs. \$11.95 pp. 256
ISBN 0-07-006745-7

70 Main Street, Peterborough, NH 03458

The BYTE Book of Pascal

Edited by *Blaise W. Liffick*
Based on the growing popularity of Pascal as a programming language, numerous articles, language forums and letters from past issues of *BYTE* magazine have been compiled to provide this general introduction to Pascal. In addition, this book contains several important pieces of software including two versions of a Pascal compiler - one written in BASIC and the other in 8080 assembly language; a p-code interpreter written in both Pascal and 8080 assembly languages; a chess playing program; and an APL interpreter written in Pascal. \$25.00 Hardcover pp. 342
ISBN 0-07-037823-1
Circle 36 on inquiry card.

These books will be available in January 1980 at your favorite computer bookstore or direct from *BYTE*[™]

Come Help Us Celebrate The Child

St. Jude Children's Research Hospital continues its search for life-saving knowledge about catastrophic childhood disease. And this search continues because people care. There's no charge to patients or their families once admitted to its research studies by physician referral. The cost of drugs, equipment, and research programs is met primarily by public contributions. Help us celebrate the child by sending your tax-deductible check or request for further information to St. Jude Children's

Research Hospital,
539 Lane Ave.,
Memphis, TN 38105.

GREAT PET SOFTWARE

"Precise, humanized, well documented an excellent value" are the applauds now being given to United Software's line of software. These are sophisticated programs designed to meet the most stringent needs of individuals and business professionals. Every package is fully documented and includes easy to understand operator instructions.

DATABASE MANAGEMENT SYSTEM - A comprehensive, interactive system like those run on mainframes! Six modules comprising 42K of programming allow you to; create, edit, delete, display, print, sort, merge, etc., etc. - databases of up to 10,000 records. Printer routines automatically generate reports and labels on demand. 60 pages of concise documentation are included. Requirements - 16-32K PET and 2040 Dual Disk (printer optional). . . .Cost \$125

ACCOUNTS RECEIVABLE/PAYABLE - A complete, yet simple to use accounting system designed with the small businessman in mind. The United Software system generates and tracks purchase orders and invoices all the way through posting "controlled" accounts payable and accounts receivable subsystems. Keyed Random Access file methods makes data access almost

instantaneous. The low-cost solution for the first time computer user with up to 500 active accounts. Requirements - 32K PET, Dual Disk, any 80-column printer. . . .Cost \$175

CASH RECEIPTS & DISBURSEMENTS - Makes it a breeze to track all outgoing payments made by any type of business operation. Checks are tracked by number and categorized by type of expense. Sorting, summary, and audit trails make it easy to post to general ledger. This system also categorizes incoming receipts. Uses KRAM file access method. Requirements - 32K PET, Dual Disk (printer optional). . . .Cost \$99.95

KRAM - Keyed Random Access Method - The new, ultra-fast access method for the PET Disk, provides keyed retrieval/storage of data, in either direct or sequential mode, by either full or partial key values. Written by United Software in 6502 machine code, and designed with the PET in mind, it exploits all the benefits of the PET Disk, allowing full optimization of your system. Eliminates the need for "Sort" routines! KRAM provides flexibility never seen on a micro before. KRAM is modeled after a very powerful access method used on large-scale IBM Virtual Storage mainframes. So "KRAM" all you can into your PET - it will love you for it. . . .Cost \$79.95

(Sublicenses available to software houses.)

HARD DISK.... Back-Up

Winchester disk technology brings a new generation of lo-cost, hi-capacity multi-megabyte fixed storage to mini and micro-computer systems. And a new set of problems...how to back up valuable data. Saving a 10 Mbyte hard disk on floppy disks can require 10-20 floppies and can take an hour or more.

Our Back-Up software solves the problem...with Alloy Engineerings DEI cartridge tape system. Compared to floppy disks, the cartridge tape system typically saves 75% of the time and saves 75% of the media cost. And without the confusion of filing 10-20 disks.

Cartridge tapes excell even with fixed/removable disks and cartridge disks. Media costs for cartridge tapes are typically only one-quarter the cost of removable disk modules. And cartridge tapes require only about 10% of the space of removable disk packs/cartridges.

Put your valuable data on-line with a hard disk...save it off-line with an Alloy/DEI cartridge tape system. And save time, money, space, confusion and aggravation.

The hardware is £-100, and Back-Up is compatible with CP/M, CDOS, IMDOS, & PDOS. Contact us for details.

AIM 65

AIM 65 is fully assembled, tested and warranted. With the addition of a low cost, readily available power supply, it's ready to start working for you. It has an addressing capability up to 65K bytes, and comes with a user-dedicated 1K or 4K RAM.

- Thermal Printer
- Full-Size Alphanumeric Keyboard
- True Alphanumeric Display
- Proven R6500 Microcomputer System Devices
- Built-In Expansion Capability
- TTY and Audio Cassette Interfaces
- ROM Resident Advanced Interactive Monitor
- Advanced Interactive Monitor Commands

PRICE: \$375.00 (1K RAM)

Plus \$4.00 UPS (shipped in U.S. must give *street* address), \$10 parcel post to APO's, FPO's, Alaska, Hawaii, Canada, \$25 air mail to all other countries

We manufacture a complete line of high quality expansion boards. Use reader service card to be added to our mailing list, or U.S. residents send \$1.00 (International send \$3.00 U.S.) for airmail delivery of our complete catalog.

VAK-4 16K STATIC RAM BOARD

- Designed specifically for use with the AIM-65, SYM-1, and KIM-1 microcomputers
- Two separately addressable 8K-blocks with write protect.
- Designed for use with the VAK-1 or KIM-4* motherboards
- Has provisions for mounting regulators for use with an unregulated power supply
- Made with 1st quality 2114 static ram chips
- All IC's are socketed
- Completely assembled, burned-in, and tested

We manufacture a complete line of high quality expansion boards. Use reader service card to be added to our mailing list, or U.S. residents send \$1.00 (International send \$3.00 U.S.) for airmail delivery of our complete catalog.

APPLE PLUGBOARD

Vector 4609 Peripheral Interface Plugboard for construction of custom circuits. Plug compatible with Apple II, Commodore PET and Super Kim microcomputers. Three connectors, in addition to the standard 25/50 system bus, are available for input/output. A 20/40-contact card-edge connector, fabricated on the rear of the board, mates with a 3-M type ribbon connector. Alternatively, a right-angle solder-tail header may be positioned in this same location. The Model 4609 also accommodates the miniature SIP-type connectors which may be placed on the periphery or in mid-board.

8803 MOTHER BOARD FOR S100 BUS MICRO-COMPUTERS

Includes 12 tantalum capacitors for +5, +12, -12 buses and more. Includes 50 pin headers. Wires down. Components and bare solder. Glass with white markings for component locations. Complete locations. 6 0/10 pin headers with 20 wire copper solder pads and 038 gauge metal foil traces. Solder mask with solder windows on entire circuit board and accidental short circuit. Mounts 11 receptacles with 100 contacts (2 rows) in 125 pin and 250 pin sockets. Vector part number R881-2 ornaments 11 receptacles with interconnections to smaller mother board locations. Includes schematics and instructions for option of Active, Pull-up or Floating terminations. Includes 25 pin (0310 AMP) and 12 pin (0110 AMP) connectors. Current ratings as per MIL-STD-275 with 10% rise. Fits in Vector 8800 boards. Fits in IMSAI 8080 microcomputer as expansion board.

Price: \$29.50

4 MHZ EXPANDORAM II KIT

The S-100 Memory Board for the 80's

NEW

SD SYSTEMS' ExpandoRAM II is a state-of-the-art dynamic RAM board with capacities from 16K bytes (4116) to 256K bytes (4164). It operates on the industry S-100 Bus. The ExpandoRAM II's design allows eight boards to operate from the same S-100 Bus. Page mode operation provides the system with the capability of servicing multiple users without RAM interference. Invisible refresh and synchronization with wait states provide greater reliability, and processing speeds up to 4 Mhz.

- S-100 Bus Compatible
- Up to 4Mhz Operation
- Expandable Memory from 16K to 256K
- DIP Switch Selectable Boundaries
- Uses 16K (4115) or 64K (4164) Memory Devices
- Page Mode Operation Allows up to 8 Memory Boards on Bus
- Operates with Z80 CPU's
- Phantom Output Disable
- Invisible Refresh (Synchronized with Wait States)

Sale Price

SDS - EXPANDORAM II KIT (4116)

16K	\$280.00	48K	\$450.00
32K	\$365.00	64K	\$535.00

The ExpandoRAM II is compatible with most S-100 CPU's based on the Z80 microprocessor. When other SD SYSTEMS 200 series boards are combined with the ExpandoRAM II, they create a microcomputer with exceptional capabilities and features.

The EXPANDORAM is available in versions from 16K up to 64K, so for a minimum investment you can have a memory system that will grow with your needs. This is a dynamic memory with the invisible on-board refresh, and IT WORKS!

- Interfaces with Altair, IMSAI, SOL-8, Cromemco, SBC-100, and others.
- Bank Selectable
- Phantom
- Power 8VDC, ± 16VDC, 5 Watts
- Lowest Cost Per Bit
- Uses Popular 4116 RAMS
- PC Board is doubled solder masked and has silk-screen parts layout.
- Extensive documentation clearly written
- Complete Kit includes all Sockets for 64K
- Memory access time: 375ns, Cycle time: 500ns.
- No wait states required.
- 16K boundaries and Protection via Dip Switches
- Designed to work with Z-80, 8080, 8050 CPU's

EXPANDOPROM

The ExpandoPROM can be populated with either the 2708 (1K) or the 2716 (2K) EPROMS, and may be located on either 16K or 32K boundaries.

- S-100 Bus Compatible
- Expandable Read Only Memory from 1K to 32K
- Each EPROM is Dip Switch Selectable
- Dip Switch for Addressing on 16K/32K Boundaries
- Dip Switch Selectable Wait States
- Interfaces with Imsai, Altair, Sol-20 Cromemco and SD SYSTEMS' Z80 CPU Cards

Z80 CENTRAL PROCESSING UNIT

- S-100 Bus Compatible
- 2 Mhz or 4 Mhz Operation
- Power-On Jump to any 4K Boundary
- On-Board Socket for up to 2K PROM
- Front Panel Usage Optional
- Z80 Microprocessor
- Optional Wait States

The MPB-100 can upgrade an existing S-100 8080 System with little or no necessary modifications. The MPB-100 is additionally suited for some control applications. The PROM socket will accommodate a 1K or 2K PROM plus the single voltage 4K PROM.

PROM-100

Programming Board for PROM Development

NEW

SD SYSTEMS' PROM-100 is a versatile PROM programming board offering complete EPROM programming capability. The board operates on the industry standard S-100 Bus. Support software verifies the erasure of EPROM and verifies the loaded program. SD SYSTEMS' PROM-100 offers a support-software listing with its operations manual.

- S-100 Bus Compatible
- Programs the Following EPROM s: 2708, Intel 2758, 2716, 2732 and Texas Instruments 2516
- Dip Switch Selection of EPROM type
- 25 VDC Programming Pulse Generated On Board
- Maximum Programming time: 16,384 Bits in 100 Seconds
- Power Requirement: +8VDC at 300 ma.; +16 VDC at 100 ma.; -16 VDC at 60 ma.
- TTL compatible
- Software Provides for Reading of Object File from SDOS, CP/M or PROM and Programming into EPROM
- Program Verification
- Verification of Erasure
- Zero Insertion Force Socket

FOR SALE: Programmatic Flexwriter, paper-tape reader punch, upper/lower case, input/output (I/O) connectors. Some schematics. \$370. Bill Fujitsu, 1506 Sandcastle Dr, Corona del Mar CA 92625.

WANTED: Assembled and working SwTPC PR-40 printer to use with my PET computer. Peter Oakes, 2235 Lakeshore Dr, Muskegon MI 49441.

FOR SALE: Shugart SA3900 dual diskette subsystem. Includes two SA900 drives, SA910 controller electronics, and large enclosure with fan and power supply. 256 K bytes/8 inch drive. Full documentation. Can be used as is, or replace the transistor-transistor logic (TTL) controller with an 8271 chip and your own microcomputer. Cabinet will hold six 8 by 10 inch boards. Original cost \$2400, will sell for \$750. Roger Cox, 1050 Westmoreland Rd Apt B, Colorado Springs CO 80907, (303) 599-9274.

FOR SALE: New Processor Technology 16 K programmable-memory board with battery backup capability. Never been used. Factory assembled and tested. \$250 or best offer. Cromemco Tu-Art, assembled and tested. \$200 or best offer. Cromemco Bytesaver, assembled with or without read-only memories (2708), not tested. \$175 without read-only memories, \$275 with read-only memories including Bytemover Z80 monitor read-only memory. David Brown, 2219 Teresa Dr, Savannah GA 31406.

FOR SALE: Solid State Music MB3 4 K erasable read-only memory board with sixteen clean 1702A read-only memories. Perfect condition, with documentation. \$110. George Saum, 4371 W 82 Av, Westminster CO 80030, (303) 429-6646.

FOR SALE: A 2201 Flexwriter made by Friden. The automatic typewriter can be programmed. It has a 5610 Compu data processor mounted in table unit. Has tape punch and reader. Has 18 inch carriage. In good condition. It is a real buy for \$800 FOB Newton. Weight 350 to 400 lbs. Jack Harrison, 810 Ridge, Newton NC 28658, (704) 464-0145.

FOR SALE: Alpha-Micro computer system, AM-100, 64 K programmable memory, 10MB CDC Hawk disk drive, AMOS operating system, Accounts Receivable, General Ledger, Payroll Software. Chester Hayes, 62 S Franklin St, Wilkes-Barre PA 18773, (717) 823-3101.

FOR SALE: Litton ABS/1252 accounting computer. System includes 80 K programmable memory, paper-tape reader and punch, keyboard, printer, buffer, rewind stand, and forms stand. Ideal for needs of a small to moderate-size business. David M Martin, 501 Webster, Mishawaka IN 46544, (219) 259-8578 (office) or (219) 259-1123 (home).

FOR SALE: BYTE magazine #1 to current, inclusive. Mint condition. Best offer. K J Dabb, 2045 Robins Av, Ogden UT 84401.

FOR SALE: SOL with 5-slot S-100 cage, 16 K Dynabyte dynamic, 4 K MITS dynamic, 8 K Bytesaver, ICOM minifloppy with controller, cassette recorder, monitor Datel 30 Selectric-based terminal, USART for parallel port, PT Extended Cassette BASIC, ICOM FDOS and DEBBIE, ALS8, Editor, Disassembler, TRK80, and more. Asking minimum \$2500. Albert Boulanger, 820 NE 2 Pl, Hialeah FL 33010, (305) 888-6220.

FOR SALE: Parallel ASCII to serial ASCII converter with 20 mA current loop drive, \$20; 5 V at 3 A power supply with 45 K μ F filtering, \$30; miscellaneous power supply components (capacitors, transformers, etc) Robert Watson, 2853 Pebble Beach, Flagstaff AZ 86001, (602) 526-2312.

FOR SALE: Micromation Megabox System, dual drive, 8 inch, double density, with controller card, \$1600. Thinker Toys, 16 K static programmable memory, 4 MHz, \$275. Both items brand new. Full documentation. James R Fatz, 293 Indiana Av, Ft Wood MO 65473, (314) 368-5880.

WANTED: I have eight 1702A erasable read-only memories which I bought used on a printed circuit board. I would like to erase them, verify the erasure, program every bit, verify the programming, then erase the read-only memories, verifying the erasure. Finally, I need to have one read-only memory programmed for a keyboard encoder. Robert Heller, POB 51A Star Rt, Wendell MA 01379.

FOR SALE OR TRADE: For LSI-11, Heath H11, 11A owners. 4 K core (MMV11) used as small disk, keep loader, or BASIC in nonvolatile residence. \$450, or trade for on board refreshed 16 K programmable memory module. C Chi, (617) 369-4000 ext 340 work; (617) 842-6326 home.

FOR TRADE: Have BYTE issues #1 and #4 in mint condition. Will trade for January, February, and May 1976 issues of BYTE in comparable condition. Will Hobbs, 1917 NE 8th #3, Portland OR 97212, (503) 284-5150.

WANTED: Ran out of space in my H11 system. I would like to trade my one each or two each H11-1, 4 K x 16 memory board plus reasonable cash for a single board 16 K x 16 memory board for H11. Must be in working condition. P Reyes, 86-115 Puhawai Rd, Waianae HI 96792, (808) 696-9329.

FOR SALE: Four Heath 4 K by 16 static-memory modules. Assembled and guaranteed working. Specify bank number and I will program before shipping. \$200 each or \$700 for all four. Harold Bula, 111 NW 8th Av #B4, Hallandale FL 33009.

FOR SALE: Heathkit ET-3400 microprocessor trainer in excellent condition with all manuals and programmed learning notebooks. Many additional chips and accessories. Nathan Coates, Rt 1 POB 44, Abilene TX 79601.

FOR SALE: 16 K, Level II TRS-80. Also, Tektronix type RM35A oscilloscope with type CA dual-trace plug-in unit and type D differential-input plug-in unit. TRS-80, \$645. Oscilloscope with both plug-in units, \$295. Richard J Aspey, 234 Beachwood Dr, Burbank CA 91506, (213) 842-7947.

ZILOG USERS: Zilog user seeks an exchange of ideas. Frank Light, 64 Errwood Rd, Manchester M19 2QH, ENGLAND.

FOR SALE: S&D Sales 4 K programmable memory, \$50. Shugart SA-400 with power supply and cabinet, \$290. Micromation PerSci double density, \$2200. MITS serial input/output (I/O) board, \$100. Vector Graphics read-only memory/programmable memory, \$75. Ten 1702A read-only memories, \$35. S&D cassette interface, \$14. 3P + S I/O board, \$130. Flexwriter with S-100 interface, punch, and reader, \$375. Fred Manthey, POB 619, Mulian ID 83846, (208) 744-1143.

FOR SALE: S-100 boards: IA, Z80, Jade input/output (I/O), \$100 each. SD 4 K programmable memory, \$50. Digital cassette drive with control electronics, \$50. PAIA 400 synthesizer, \$300. Anthony Lassiter, 630 S Hermitage #402, Chicago IL 60612, (312) 942-4837.

WANTED: New or used dumb terminal and acoustic coupler, or a microcomputer with RS-232 interface and terminal capability. Lee Hayden, 5018 San Jose Blvd, Jacksonville FL 32207.

Unclassified Policy

Readers who are soliciting or giving advice, or who have equipment to buy, sell or swap should send in a clearly typed notice to that effect. To be considered for publication, an advertisement must be clearly noncommercial, typed double spaced on plain white paper, contain 75 words or less, and include complete name and address information.

These notices are free of charge and will be printed one time only on a space available basis. Notices can be accepted from individuals or bona fide computer users clubs only. We can engage in no correspondence on these and your confirmation of placement is appearance in an issue of BYTE.

Please note that it may take three or four months for an ad to appear in the maga: ie.

FOR SALE: Heath H8, H9, 24 K, dual cassettes, fully assembled and operational. Includes all assembly manuals, reference manuals, software (plus Extended BH BASIC with files), Space Wars game, HUG library manual and tape, and back issues of REMark Magazine. \$1450/offer. J Scheip, 6487 Silver Ridge Cir, Alexandria VA 22310, (703) 971-9619.

FOR SALE: Micropolis 1043 Mod II, 315 K bytes formatted meta floppy disk. Complete with manual, newsletters, and S-100 bus-controller board. Moving up to larger system. First check for \$950 takes all. Paul E Feick, 1105 Maia Dr, Layton UT 84041, (801) 376-9515 home, 524-4140 work.

WANTED: Newly formed computer club wants free games and/or other programs to run on a Level II TRS-80 system. Any consideration will be greatly appreciated. Bruce Caldwell, Draughon's Computer Club, Draughon's Junior College, 131 8th Av, Nashville TN 37203.

FOR SALE: Two Godbout Econoram II boards (static 8 K, 450 ns, S-100 bus) plus four spare 2102 memory integrated circuits. \$90 each or nearest offer. I have switched to a 64 K Expendoram. Ron Subler, 25 First Parish Rd, Scituate MA 02066, (617) 545-6578.

FOR SALE: SwTPC CT-64, \$275 and AC-30, \$65. Professionally assembled, working, in as-new condition with documentation. R P Felton, 4803 Neblina Dr, Carlsbad CA 92008, (714) 729-5519.

FOR SALE: Digital Development Corp Model 12750 fixed head disk. 196 K bytes, 8.5 ms high-speed access. High reliability helium pressurized system with sixteen external track protect switches. Full documentation. Ideal for computer graphics database, or timeshare swapping storage. 19 inch side, 150 lbs, 115 VAC single phase; \$500 plus shipping. J Zeglinski, 32 Aldgate Av, Toronto Ontario, CANADA MBY 3L6.

FOR SALE: IMSAI 8080 or Cromemco Z2. Both contain full sockets and are equipped with North Star disk drive, Processor Tech 3P + S, and 8 to 32 K of memory. ADM3 terminals available and all my software for free. Best reasonable offer. J Roehrig, 7 Wildwood Dr, Dix Hills NY 11746, (516) 643-1931.

FOR SALE: Digital Group Z80 system. 26 K 21L02. Maxi-BASIC, Assembler, four input/output (I/O) ports, 64-character video board, power supply. Great system for Assembly or BASIC. \$650. Preston Marshall, 8525 Monticello Av, Alexandria VA 22308, (703) 780-3768.

FOR SALE: Atari video computer system. Very good condition. Cartridges include Surround, Indy 500, Breakout, Outlaw, Air Sea Battle, Combat, Street Racer, Starship, Video Olympics, and Homerun. All handles for games come with system. System is worth \$400, best offer takes it. Jody Wear, Rt 1 POB 83A, New Egypt NJ 08533, (609) 758-7193 after 3:30 PM.

September BOMB Homebrewing: Soft Touch for Software

Congratulations to Mark Dahmke for his first place winning article "Introduction to Multiprogramming," September, page 20. An extremely close second place was taken by Steve Ciarcia's "Joystick Interfaces," page 10 with third place being awarded to William Powers, "The Nature of Robots," Part 4, page 96. ■

For fastest service transfer mailer label from wrapper to coupon provided at the right. Requests cannot be honored unless zip code is given. This card valid for 90 days only.

NOTE- If label is missing or defaced fill out coupon carefully -PLEASE PRINT-this is only way to get requested material to you.

BYTE's BOMB is your direct line to the editor's desk. Each month, the two top rated authors receive bonuses based on your votes. To use this card, refer to the list of authors, titles, and corresponding BOMB article numbers on the opposite page. Then rate each article on a scale from 0 to 10 below by circling the appropriate rating number to the right of each BOMB article number. Your feedback helps us produce the best possible magazine each month.

BYTE's Ongoing Monitor Box

There's A World of Difference In Business Software!

Graham-Dorian's Integrated, On-Line Programs Are Fast, Efficient, And Easy To Use.

Rely on Graham-Dorian, a full-line computer software manufacturer, for sophisticated programs — the most detailed on the market today. They're ready to go to work immediately or to be tailored for even more specific needs.

On-line capabilities enable you to make a single entry and update all affected files. An inquiry into a file at any time provides up-to-date information — no batching or sorting of input data.

The programs are easy to use. Messages on the video display guide you each step of the way. Programs make use of indexed sequential and chained files for fast and convenient retrieval of data with efficient use of disk space.

Order on standard eight-inch disk or various mini-floppy formats. Each program contains a free user's manual and hard copy source listing.

- **Accounts Receivable** — Records invoices, prepares statements and trial balance reports, etc. Automatically reports aging of accounts in periods of 30, 60, and 90 days, with each item listed separately.
- **Accounts Payable** — Vendor lookup and change, entering vendor invoices, writing checks (many options), cash flow analysis, accounts payable check register, and vendor list. Ideal for analyzing expenditures by vendor and by due date.

- **General Ledger** — Includes lookup and change, making journal entries, trial balance, transaction register, chart of accounts, financial statements, and monthly closing.

- **Job Costing** — Provides work order lookup, enters labor transactions, material set-up, progress report of hours, labor distribution report, weekly labor reset, actual versus estimated cost per job.

- **Inventory** — Can be connected with cash register for point of sale inventory control. Number of on-line items limited only by disk space available.

- **Cash Register** — Creates daily sales reports containing information on gift certificates, payouts, overrings, refunds, and how much in each category a salesperson sold.

- **Payroll** — Handles 100% of all necessary payroll functions including state income tax tables for your state. Ideally suited for both large and small companies.

- **Apartment** — Said one user, "Obviously, this was developed by apartment owners." The package fills virtually all the needs of apartment owners and managers. Ideal for projects with 75 units or more.

- **CBASIC-2** — The most comprehensive and powerful commercially oriented BASIC available today. Enhancements over CBASIC-1: integer variables, multiple line functions, CHAINing with COMMON variables, additional predefined functions, etc.

Compatible with many computers: Northstar, IMSAI, Altos, Cromenco, Industrial Micro Systems, Radio Shack TRS-80 Model II, SD Systems, Digital Microsystems, Dynabyte DBB/2, Micropolis MOD II, Vector MZ, and other 8080, 8085, and Z-80-based systems.

See your GDSS dealer or send for information packet and sample runs.

The Personal Computer Line by OHIO SCIENTIFIC

Personal Computers

C1P: \$349 A dramatic breakthrough in price and performance. Features OSI's ultra-fast BASIC-in-ROM, full graphics display capability, and large library of software on cassette and disk, including entertainment programs, personal finance, small business, and home applications. It's a complete programmable computer system ready to go. Just plug-in a video monitor or TV through an RF converter, and be up and running. 15K total memory including 8K BASIC and 4K RAM—expandable to 8K.

C1P MF: \$995 First floppy disk based computer for under \$1000! Same great features as the C1P plus more memory and instant program and data retrieval. Can be expanded to 32K static RAM and a second mini-floppy. It also supports a printer, modem, real time clock, and AC remote interface, as well as OS-65D V3.0 development disk operating system.

Professional Portables

C4P: \$698 The professional portable that has over three times the display capability of C1Ps. Features 32 x 64 character display in up to 16 colors, graphics, audio output, a DAC for voice and music generation, key pad and joystick interfaces, AC remote control interface and much more. Utilizes a 4-slot BUS (2 used in base machine), 8K BASIC-in-ROM, 8K of static RAM and audio cassette interface. Can be directly expanded to 32K static RAM and two mini-floppy disks.

C4P MF: \$1695 The ultimate portable computer has all the features of the C4P plus real time clock, home security system interface, modem interface, printer interface, 16 parallel lines and an accessory BUS. The standard machine operates at twice the speed of currently available personal computers (with GT option it runs even faster!). The C4P MF starts with 24K RAM and a single mini-floppy and can be directly expanded to 48K and two mini-floppies. Available software includes games, personal, business, educational and home control applications programs as well as a real time operating system, word processor and a data base management system.

*Monitors and cassette recorders not included. Ohio Scientific offers a combination TV/Monitor (AC-3P) for \$115.

Home/Small Business Systems

C8P: \$895 Same great features as the C4P in a tremendously expandable "main-frame package." Features over three times the expansion capability of the C4P for advanced home and demanding business applications. Can be expanded to 48K RAM, dual 8" floppies, hard (Winchester) disks and multiple I/O devices such as Voice I/O and a universal telephone interface.

C8P DF: From \$2597 The ultimate Home/Very Small Business Computer at a personal computer price. Features 32K RAM (expandable to 48K) and dual 8" floppy disks (stores eight times as much information as a mini-floppy). Has all personal computer capabilities including 32 x 64 display, color graphics, sound, DAC, joystick interfaces, home features including real time clock, AC remote interface, home security and fire detection interface and can be expanded to include voice I/O and a universal telephone system for answering and initiating calls! Its large memory capability and 8" floppies allow it to run most Ohio Scientific business system software including a complete accounting system, word processor and information management system.
