## 10917 A Walk Through the Forest

Jimmy experiences a lot of stress at work these days, especially since his accident made working difficult. To relax after a hard day, he likes to walk home. To make things even nicer, his office is on one side of a forest, and his house is on the other. A nice walk through the forest, seeing the birds and chipmunks is quite enjoyable.

The forest is beautiful, and Jimmy wants to take a different route everyday. He also wants to get home before dark, so he always takes a path to make progress towards his house. He considers taking a path from A to B to be progress if there exists a route from B to his home that is shorter than any possible route from A. Calculate how many different routes through the forest Jimmy might take.

## Input

Input contains several test cases followed by a line containing ' 0 '. Jimmy has numbered each intersection or joining of paths starting with 1 . His office is numbered 1 , and his house is numbered 2 . The first line of each test case gives the number of intersections $N, 1<N \leq 1000$, and the number of paths $M$. The following $M$ lines each contain a pair of intersections $a b$ and an integer distance $1 \leq d \leq 1000000$ indicating a path of length $d$ between intersection $a$ and a different intersection $b$. Jimmy may walk a path any direction he chooses. There is at most one path between any pair of intersections.

## Output

For each test case, output a single integer indicating the number of different routes through the forest. You may assume that this number does not exceed 2147483647.
