

## 12935 Graph Guessing

There is a strongly-connected graph (i.e. you can reach any node from any other node) with  $n$  nodes and  $m$  edges. I will choose some of the edges to make another strongly connected graph. Your task is to guess that graph. Too difficult, right? Don't worry, you only need to guess  $k$  edges. If all the edges exist in my graph, you win. I promise that from all possible graphs, the answer will be chosen uniformly. **The original graph will not have self-loops or duplicated edges.**

You already have a guess, but you are a bit unsure. Why not write a program to calculate the probability you win? For example, if  $n = 4$ ,  $m = 5$ , the original graph has 5 edges:  $1 \rightarrow 2$ ,  $2 \rightarrow 3$ ,  $3 \rightarrow 4$ ,  $4 \rightarrow 1$ ,  $1 \rightarrow 3$ , there are only two possible answers:

If  $k = 2$ , the best way is to guess edge  $1 \rightarrow 2$  and  $2 \rightarrow 3$  (or  $1 \rightarrow 2$  and  $3 \rightarrow 4$  etc.) which will guarantee a win. But if you would like to risk by guessing edges  $1 \rightarrow 3$  and  $2 \rightarrow 3$ , the probability you win is 0.5.

### Input

There will be at most 10 test cases. Each case begins with two integers  $n, m$  ( $3 \leq n \leq 15$ ,  $2 \leq m \leq 50$ ). Each of the following  $m$  lines contains two different integers  $u, v$  ( $1 \leq u, v \leq n$ ), that means  $u \rightarrow v$  is in the original graph. Edges are numbered 1 to  $m$  in the same order they appear in the input. The last line begins with an integer  $k$  ( $1 \leq k \leq m$ ) and  $k$  different integers, the edges you guess.

### Output

For each test case, print the case number and the probability you win. Absolute error of  $10^{-4}$  is allowed.

### Sample Input

```
4 5
1 2
2 3
3 4
4 1
1 3
2 1 2
4 5
1 2
2 3
3 4
```

4 1  
1 3  
2 5 2

**Sample Output**

Case 1: 1.0000  
Case 2: 0.5000
