## 900 Brick Wall Patterns

If we want to build a brick wall out of the usual size of brick which has a length twice as long as its height, and if our wall is to be two units tall, we can make our wall in a number of patterns, depending on how long we want it. From the figure one observe that:

- There is just one wall pattern which is 1 unit wide made by putting the brick on its end.
- There are 2 patterns for a wall of length 2: two sideways bricks laid on top of each other and two bricks long-ways up put next to each other.

4 ???

- There are three patterns for walls of length 3 .

How many patterns can you find for a wall of length 4? And, for a wall of length 5?
Your task is to write a program that given the length of a wall, determines how many patterns there may be for a wall of that length.

## Input

Your program receives a sequence of positive integers, one per line, each representing the length of a wall. The maximum value for the wall is length 50 . The input terminates with a ' 0 '.

## Output

For each wall length given in the input, your program must output the corresponding number of different patterns for such a wall in a separate line.

## Sample Input

## 1

2
3
0

## Sample Output

1
2
3
